Malte Zöckler

**HYPRE_StructGridSetPeriodic** (HYPRE_StructGrid grid, int* periodic)

*Set the periodicity for the grid.* ..............................................

1.1.7

**int**

**HYPRE_StructGridSetNumGhost** (HYPRE_StructGrid grid, int* num_ghost)

*Set the ghost layer in the grid object* ......................................

typedef struct hypre_StructGrid_struct *HYPRE_StructGrid

A grid object is constructed out of several “boxes”, defined on a global abstract index space.

1.1.2

**int**

**HYPRE_StructGridCreate** (MPI_Comm comm, int ndim, HYPRE_StructGrid* grid)

Create an ndim-dimensional grid object.

1.1.3

**int** **HYPRE_StructGridDestroy** (HYPRE_StructGrid grid)

Destroy a grid object. An object should be explicitly destroyed using this destructor when the user’s code no longer needs direct access to it. Once destroyed, the object must not be referenced again. Note that the object may not be deallocated at the completion of this call, since there may be internal package references to the object. The object will then be destroyed when all internal reference counts go to zero.
1.1.4

```c
int HYPRE_StructGridSetExtents (HYPRE_StructGrid grid, int* ilower, int* iupper)
```

Set the extents for a box on the grid.

1.1.5

```c
int HYPRE_StructGridAssemble (HYPRE_StructGrid grid)
```

Finalize the construction of the grid before using.

1.1.6

```c
int HYPRE_StructGridSetPeriodic (HYPRE_StructGrid grid, int* periodic)
```

Set the periodicity for the grid.

The argument `periodic` is an `ndim`-dimensional integer array that contains the periodicity for each dimension. A zero value for a dimension means non-periodic, while a nonzero value means periodic and contains the actual period. For example, periodicity in the first and third dimensions for a 10x11x12 grid is indicated by the array `[10,0,12]`.

NOTE: Some of the solvers in hypre have power-of-two restrictions on the size of the periodic dimensions.

1.1.7

```c
int HYPRE_StructGridSetNumGhost (HYPRE_StructGrid grid, int* num_ghost)
```

Set the ghost layer in the grid object.
1.2

Struct Stencils

Names

1.2.1  typedef struct hypre_StructStencil_struct *HYPRE_StructStencil
    The stencil object

1.2.2  int HYPRE_StructStencilCreate (int ndim, int size, HYPRE_StructStencil* stencil)
    Create a stencil object for the specified number of spatial dimensions and stencil entries

1.2.3  int HYPRE_StructStencilDestroy (HYPRE_StructStencil stencil)
    Destroy a stencil object

1.2.4  int HYPRE_StructStencilSetElement (HYPRE_StructStencil stencil, int entry, int* offset)
    Set a stencil entry.

1.2.1  typedef struct hypre_StructStencil_struct *HYPRE_StructStencil

The stencil object

1.2.2  int HYPRE_StructStencilCreate (int ndim, int size, HYPRE_StructStencil* stencil)

Create a stencil object for the specified number of spatial dimensions and stencil entries
1.2.3

```c
int HYPRE_StructStencilDestroy (HYPRE_StructStencil stencil)
```

Destroy a stencil object

1.2.4

```c
int HYPRE_StructStencilSetElement (HYPRE_StructStencil stencil, int entry, int* offset)
```

Set a stencil entry.

NOTE: The name of this routine will eventually be changed to HYPRE_StructStencilSetEntry.

1.3.7 int \texttt{HYPRE\_StructMatrixSetConstantValues} (HYPRE\_StructMatrix matrix, int\ nentries, int*\ entries, double*\ values)

*Set matrix coefficients which are constant over the grid.*

1.3.8 int \texttt{HYPRE\_StructMatrixAddToConstantValues} (HYPRE\_StructMatrix matrix, int\ nentries, int*\ entries, double*\ values)

*Add to matrix coefficients which are constant over the grid.*

1.3.9 int \texttt{HYPRE\_StructMatrixSetBoxValues} (HYPRE\_StructMatrix matrix, int*\ ilower, int*\ iupper, int\ nentries, int*\ entries, double*\ values)

*Set matrix coefficients a box at a time.*

1.3.10 int \texttt{HYPRE\_StructMatrixAddToBoxValues} (HYPRE\_StructMatrix matrix, int*\ ilower, int*\ iupper, int\ nentries, int*\ entries, double*\ values)

*Add to matrix coefficients a box at a time.*

1.3.11 int \texttt{HYPRE\_StructMatrixAssemble} (HYPRE\_StructMatrix matrix)

*Finalize the construction of the matrix before using.*

1.3.12 int \texttt{HYPRE\_StructMatrixGetValues} (HYPRE\_StructMatrix matrix, int*\ index, int nentries, int*\ entries, double*\ values)

*Get matrix coefficients index by index.*

1.3.13 int \texttt{HYPRE\_StructMatrixGetBoxValues} (HYPRE\_StructMatrix matrix, int*\ ilower, int*\ iupper, int\ nentries, int*\ entries, double*\ values)

*Get matrix coefficients a box at a time.*

1.3.14 int \texttt{HYPRE\_StructMatrixSetSymmetric} (HYPRE\_StructMatrix matrix, int symmetric)

*Define symmetry properties of the matrix.*

1.3.15 int \texttt{HYPRE\_StructMatrixSetConstantEntries} (HYPRE\_StructMatrix matrix, int\ nentries, int*\ entries)

*Specify which stencil entries are constant over the grid.*

1.3.16 int
**HYPRE_StructMatrixSetNumGhost** (HYPRE_StructMatrix matrix, int* num_ghost)

Set the ghost layer in the matrix

1.3.17 int

**HYPRE_StructMatrixPrint** (const char* filename, HYPRE_StructMatrix matrix, int all)

Print the matrix to file.

1.3.18 int

**HYPRE_StructMatrixMatvec** (double alpha, HYPRE_StructMatrix A, HYPRE_StructVector x, double beta, HYPRE_StructVector y)

Matvec operator.

1.3.1
typedef struct hypre_StructMatrix_struct *HYPRE_StructMatrix

The matrix object

1.3.2

int **HYPRE_StructMatrixCreate** (MPI_Comm comm, HYPRE_StructGrid grid, HYPRE_StructStencil stencil, HYPRE_StructMatrix* matrix)

Create a matrix object

1.3.3

int **HYPRE_StructMatrixDestroy** (HYPRE_StructMatrix matrix)

Destroy a matrix object
1.3.4

\begin{verbatim}
int HYPRE_StructMatrixInitialize (HYPRE_StructMatrix matrix)
\end{verbatim}

Prepare a matrix object for setting coefficient values

1.3.5

\begin{verbatim}
int HYPRE_StructMatrixSetValues (HYPRE_StructMatrix matrix, int* index, int nentries, int* entries, double* values)
\end{verbatim}

Set matrix coefficients index by index. The \texttt{values} array is of length \texttt{nentries}.

NOTE: For better efficiency, use HYPRE_StructMatrixSetBoxValues to set coefficients a box at a time.

1.3.6

\begin{verbatim}
int HYPRE_StructMatrixAddToValues (HYPRE_StructMatrix matrix, int* index, int nentries, int* entries, double* values)
\end{verbatim}

Add to matrix coefficients index by index. The \texttt{values} array is of length \texttt{nentries}.

NOTE: For better efficiency, use HYPRE_StructMatrixAddToBoxValues to set coefficients a box at a time.

1.3.7

\begin{verbatim}
int HYPRE_StructMatrixSetConstantValues (HYPRE_StructMatrix matrix, int nentries, int* entries, double* values)
\end{verbatim}

Set matrix coefficients which are constant over the grid. The \texttt{values} array is of length \texttt{nentries}.
### 1.3.8

```c
int HYPRE_StructMatrixAddToConstantValues (HYPRE_StructMatrix matrix, int nentries, int* entries, double* values)
```

Add to matrix coefficients which are constant over the grid. The `values` array is of length `nentries`.

### 1.3.9

```c
int HYPRE_StructMatrixSetBoxValues (HYPRE_StructMatrix matrix, int* ilower, int* iupper, int nentries, int* entries, double* values)
```

Set matrix coefficients a box at a time. The data in `values` is ordered as follows:

```c
m = 0;
for (k = ilower[2]; k <= iupper[2]; k++)
    for (j = ilower[1]; j <= iupper[1]; j++)
        for (i = ilower[0]; i <= iupper[0]; i++)
            for (entry = 0; entry < nentries; entry++)
                {
                    values[m] = ...;
                    m++;
                }
```

### 1.3.10

```c
int HYPRE_StructMatrixAddToBoxValues (HYPRE_StructMatrix matrix, int* ilower, int* iupper, int nentries, int* entries, double* values)
```

Add to matrix coefficients a box at a time. The data in `values` is ordered as in `HYPRE_StructMatrixSetBoxValues`.
1.3.11

int HYPRE_StructMatrixAssemble (HYPRE_StructMatrix matrix)

Finalize the construction of the matrix before using

1.3.12

int HYPRE_StructMatrixGetValues (HYPRE_StructMatrix matrix, int* index, int nentries, int* entries, double* values)

Get matrix coefficients index by index. The values array is of length nentries.

NOTE: For better efficiency, use HYPRE_StructMatrixGetBoxValues to get coefficients a box at a time.

1.3.13

int HYPRE_StructMatrixGetBoxValues (HYPRE_StructMatrix matrix, int* ilower, int* iupper, int nentries, int* entries, double* values)

Get matrix coefficients a box at a time. The data in values is ordered as in HYPRE_StructMatrixSetBoxValues.

1.3.14

int HYPRE_StructMatrixSetSymmetric (HYPRE_StructMatrix matrix, int symmetric)

Define symmetry properties of the matrix. By default, matrices are assumed to be nonsymmetric. Significant storage savings can be made if the matrix is symmetric.
1.3.15

```c
int HYPRE_StructMatrixSetConstantEntries ( HYPRE_StructMatrix matrix, int nentries, int* entries )
```

Specify which stencil entries are constant over the grid. Declaring entries to be “constant over the grid” yields significant memory savings because the value for each declared entry will only be stored once. However, not all solvers are able to utilize this feature.

Presently supported:

- no entries constant (this function need not be called)
- all entries constant
- all but the diagonal entry constant

1.3.16

```c
int HYPRE_StructMatrixSetNumGhost (HYPRE_StructMatrix matrix, int* num_ghost)
```

Set the ghost layer in the matrix

1.3.17

```c
int HYPRE_StructMatrixPrint (const char* filename, HYPRE_StructMatrix matrix, int all)
```

Print the matrix to file. This is mainly for debugging purposes.
1.3.18

```c
int HYPRE_StructMatrixMatvec ( double alpha, HYPRE_StructMatrix A, HYPRE_StructVector x, double beta, HYPRE_StructVector y )
```

Matvec operator. This operation is \( y = \alpha Ax + \beta y \). Note that you can do a simple matrix-vector multiply by setting \( \alpha = 1 \) and \( \beta = 0 \).

1.4

**Struct Vectors**

**Names**

1.4.1

```c
typedef struct hypre_StructVector_struct *HYPRE_StructVector
```

*The vector object* ................................................................. [17]

1.4.2

```c
int HYPRE_StructVectorCreate (MPI_Comm comm, HYPRE_StructGrid grid, HYPRE_StructVector* vector)
```

*Create a vector object* ......................................................... [17]

1.4.3

```c
int HYPRE_StructVectorDestroy (HYPRE_StructVector vector)
```

*Destroy a vector object* ....................................................... [17]

1.4.4

```c
int HYPRE_StructVectorInitialize (HYPRE_StructVector vector)
```

*Prepare a vector object for setting coefficient values* ................. [18]

1.4.5

```c
int HYPRE_StructVectorSetValues (HYPRE_StructVector vector, int* index, double value)
```

*Set vector coefficients index by index.* .................................. [18]

1.4.6

```c
int HYPRE_StructVectorAddToValues (HYPRE_StructVector vector, int* index, double value)
```

*Add to vector coefficients index by index.* ................................ [18]

1.4.7

```c
int HYPRE_StructVectorSetBoxValues (HYPRE_StructVector vector, int* ilower, int* iupper, double* values)
```

*Set vector coefficients a box at a time.* .................................. [18]

1.4.8

```c
int HYPRE_StructVectorAddToBoxValues (HYPRE_StructVector vector, int* ilower, int* iupper, double* values)
```

*Add to vector coefficients a box at a time.* ............................... [19]

1.4.9
HYPRE_StructVectorAssemble (HYPRE_StructVector vector)
Finalize the construction of the vector before using .................... [19]

1.4.10 int HYPRE_StructVectorGetValues (HYPRE_StructVector vector, int* index,
                               double* value)
Get vector coefficients index by index. ................................. [19]

1.4.11 int HYPRE_StructVectorGetBoxValues (HYPRE_StructVector vector,
                               int* ilower, int* iupper,
                               double* values)
Get vector coefficients a box at a time. ............................... [20]

1.4.12 int HYPRE_StructVectorPrint (const char* filename,
                               HYPRE_StructVector vector, int all)
Print the vector to file. .................................................. [20]

1.4.1
typedef struct hypre_StructVector struct *HYPRE_StructVector

The vector object

1.4.2
int HYPRE_StructVectorCreate (MPI_Comm comm, HYPRE_StructGrid grid,
                               HYPRE_StructVector* vector)
Create a vector object

1.4.3
int HYPRE_StructVectorDestroy (HYPRE_StructVector vector)
Destroy a vector object
1.4.4

```c
int HYPRE_StructVectorInitialize (HYPRE_StructVector vector)
```

Prepare a vector object for setting coefficient values.

1.4.5

```c
int HYPRE_StructVectorSetValues (HYPRE_StructVector vector, int* index,
                                double value)
```

Set vector coefficients index by index.

NOTE: For better efficiency, use HYPRE_StructVectorSetBoxValues to set coefficients a box at a time.

1.4.6

```c
int HYPRE_StructVectorAddToValues (HYPRE_StructVector vector, int* index,
                                  double value)
```

Add to vector coefficients index by index.

NOTE: For better efficiency, use HYPRE_StructVectorAddToBoxValues to set coefficients a box at a time.

1.4.7

```c
int HYPRE_StructVectorSetBoxValues (HYPRE_StructVector vector, int* ilower,
                                    int* iupper, double* values)
```

Set vector coefficients a box at a time. The data in `values` is ordered as follows:
m = 0;
for (k = ilower[2]; k <= iupper[2]; k++)
  for (j = ilower[1]; j <= iupper[1]; j++)
    for (i = ilower[0]; i <= iupper[0]; i++)
      { values[m] = ...;
        m++;
      }

1.4.8 int HYPRE_StructVectorAddToBoxValues (HYPRE_StructVector vector, int* ilower, int* iupper, double* values)

Add to vector coefficients a box at a time. The data in values is ordered as in HYPRE_StructVectorSetBoxValues.

1.4.9 int HYPRE_StructVectorAssemble (HYPRE_StructVector vector)

Finalize the construction of the vector before using

1.4.10 int HYPRE_StructVectorGetValues (HYPRE_StructVector vector, int* index, double* value)

Get vector coefficients index by index.

NOTE: For better efficiency, use HYPRE_StructVectorGetBoxValues to get coefficients a box at a time.
1.4.11

```c
int HYPRE_StructVectorGetBoxValues (HYPRE_StructVector vector, int* ilower,
    int* iupper, double* values)
```

Get vector coefficients a box at a time. The data in `values` is ordered as in `HYPRE_StructVectorSetBoxValues`.

---

1.4.12

```c
int HYPRE_StructVectorPrint (const char* filename, HYPRE_StructVector vector,
    int all)
```

Print the vector to file. This is mainly for debugging purposes.
SStruct System Interface

Names

2.1 SStruct Grids

2.1.1 typedef struct hypre_SStructGrid_struct *HYPRE_SStructGrid
A grid object is constructed out of several structured “parts” and an optional unstructured “part”.

2.1.2 typedef int HYPRE_SStructVariable
An enumerated type that supports cell centered, node centered, face centered, and edge centered variables.

2.1.3 int HYPRE_SStructGridCreate (MPI_Comm comm, int ndim, int nparts, HYPRE_SStructGrid* grid)
Create an ndim-dimensional grid object with nparts structured parts.

2.1.4 int HYPRE_SStructGridDestroy (HYPRE_SStructGrid grid)
Destroy a grid object.

2.1.5 int HYPRE_SStructGridSetExtents (HYPRE_SStructGrid grid, int part, int* ilower, int* iupper)
Set the extents for a box on a structured part of the grid.

This interface represents a semi-structured-grid conceptual view of a linear system.
HYPRE_SStructGridSetVariables (HYPRE_SStructGrid grid, int part,
    int nvars,
    HYPRE_SStructVariable* vartypes)

Describe the variables that live on a structured part of the grid ............ 25

2.1.7 int 
HYPRE_SStructGridAddVariables (HYPRE_SStructGrid grid, int part,
    int* index, int nvars,
    HYPRE_SStructVariable* vartypes)

Describe additional variables that live at a particular index. ................. 25

2.1.8 int 
HYPRE_SStructGridSetFEMOrdering (HYPRE_SStructGrid grid, int part,
    int* ordering)

Set the ordering of variables in a finite element problem. .................. 25

2.1.9 int 
HYPRE_SStructGridSetNeighborPart (HYPRE_SStructGrid grid, int part,
    int* ilower, int* iupper,
    int nbor_part, int* nbor_ilower,
    int* nbor_iupper, int* index_map,
    int* index_dir)

Describe how regions just outside of a part relate to other parts. .......... 26

2.1.10 int 
HYPRE_SStructGridSetSharedPart (HYPRE_SStructGrid grid, int part,
    int* ilower, int* iupper,
    int* offset, int shared_part, int* shared_ilower,
    int* shared_iupper, int* shared_offset,
    int* index_map, int* index_dir)

Describe how regions inside a part are shared with regions in other parts. 26

2.1.11 int 
HYPRE_SStructGridAddUnstructuredPart (HYPRE_SStructGrid grid,
    int ilower, int iupper)

Add an unstructured part to the grid. ........................................ 27

2.1.12 int 
HYPRE_SStructGridAssemble (HYPRE_SStructGrid grid)

Finalize the construction of the grid before using .......................... 28

2.1.13 int 
HYPRE_SStructGridSetPeriodic (HYPRE_SStructGrid grid, int part,
    int* periodic)

Set the periodicity on a particular part. ...................................... 28

2.1.14 int 
HYPRE_SStructGridSetNumGhost (HYPRE_SStructGrid grid,
    int* num_ghost)

Setting ghost in the sgrids ..................................................... 28
2.1.1
typedef struct hypre_SStructGrid_struct *HYPRE_SStructGrid

A grid object is constructed out of several structured “parts” and an optional unstructured “part”. Each structured part has its own abstract index space.

2.1.2
typedef int HYPRE_SStructVariable

An enumerated type that supports cell centered, node centered, face centered, and edge centered variables. Face centered variables are split into x-face, y-face, and z-face variables, and edge centered variables are split into x-edge, y-edge, and z-edge variables. The edge centered variable types are only used in 3D. In 2D, edge centered variables are handled by the face centered types.

Variables are referenced relative to an abstract (cell centered) index in the following way:

- cell centered variables are aligned with the index;
- node centered variables are aligned with the cell corner at relative index (1/2, 1/2, 1/2);
- x-face, y-face, and z-face centered variables are aligned with the faces at relative indexes (1/2, 0, 0), (0, 1/2, 0), and (0, 0, 1/2), respectively;
- x-edge, y-edge, and z-edge centered variables are aligned with the edges at relative indexes (0, 1/2, 1/2), (1/2, 0, 1/2), and (1/2, 1/2, 0), respectively.

The supported identifiers are:

- HYPRE_SSTRUCT_VARIABLE_CELL
- HYPRE_SSTRUCT_VARIABLE_NODE
- HYPRE_SSTRUCT_VARIABLE_XFACE
- HYPRE_SSTRUCT_VARIABLE_YFACE
- HYPRE_SSTRUCT_VARIABLE_ZFACE
- HYPRE_SSTRUCT_VARIABLE_XEDGE
- HYPRE_SSTRUCT_VARIABLE_YEDGE
- HYPRE_SSTRUCT_VARIABLE_ZEDGE
NOTE: Although variables are referenced relative to a unique abstract cell-centered index, some variables are associated with multiple grid cells. For example, node centered variables in 3D are associated with 8 cells (away from boundaries). Although grid cells are distributed uniquely to different processes, variables may be owned by multiple processes because they may be associated with multiple cells.

### 2.1.3

```c
int HYPRE_SStructGridCreate (MPI_Comm comm, int ndim, int nparts, HYPRE_SStructGrid* grid)
```

Create an `ndim`-dimensional grid object with `nparts` structured parts.

### 2.1.4

```c
int HYPRE_SStructGridDestroy (HYPRE_SStructGrid grid)
```

Destroy a grid object. An object should be explicitly destroyed using this destructor when the user’s code no longer needs direct access to it. Once destroyed, the object must not be referenced again. Note that the object may not be deallocated at the completion of this call, since there may be internal package references to the object. The object will then be destroyed when all internal reference counts go to zero.

### 2.1.5

```c
int HYPRE_SStructGridSetExtents (HYPRE_SStructGrid grid, int part, int* ilower, int* iupper)
```

Set the extents for a box on a structured part of the grid.
2.1.6

int HYPRE_SStructGridSetVariables (HYPRE_SStructGrid grid, int part, int nvars, HYPRE_SStructVariable* vartypes)

Describe the variables that live on a structured part of the grid.

2.1.7

int HYPRE_SStructGridAddVariables (HYPRE_SStructGrid grid, int part, int* index, int nvars, HYPRE_SStructVariable* vartypes)

Describe additional variables that live at a particular index. These variables are appended to the array of variables set in HYPRE_SStructGridSetVariables, and are referenced as such.

NOTE: This routine is not yet supported.

2.1.8

int HYPRE_SStructGridSetFEMOrdering (HYPRE_SStructGrid grid, int part, int* ordering)

Set the ordering of variables in a finite element problem. This overrides the default ordering described below.

Array ordering is composed of blocks of size (1 + ndim). Each block indicates a specific variable in the element and the ordering of the blocks defines the ordering of the variables. A block contains a variable number followed by an offset direction relative to the element’s center. For example, a block containing (2, 1, -1, 0) means variable 2 on the edge located in the (1, -1, 0) direction from the center of the element. Note that here variable 2 must be of type ZEDGE for this to make sense. The ordering array must account for all variables in the element. This routine can only be called after HYPRE_SStructGridSetVariables.

The default ordering for element variables (var, i, j, k) varies fastest in index i, followed by j, then k, then var. For example, if var 0, var 1, and var 2 are declared to be XFACE, YFACE, and NODE variables, respectively, then the default ordering (in 2D) would first list the two XFACE variables, then the two YFACE variables, then the four NODE variables as follows:

(0,-1,0), (0,1,0), (1,0,-1), (1,0,1), (2,-1,-1), (2,1,-1), (2,-1,1), (2,1,1)
2.1.9

```c
int HYPRE_SStructGridSetNeighborPart (HYPRE_SStructGrid grid, int part,
    int* ilower, int* iupper, int nbor_part, int* nbor_ilower, int* nbor_iupper, int*
    index_map, int* index_dir)
```

Describe how regions just outside of a part relate to other parts. This is done a box at a time.

Parts `part` and `nbor_part` must be different, except in the case where only cell-centered data is used.

Indexes should increase from `ilower` to `iupper`. It is not necessary that indexes increase from `nbor_ilower` to `nbor_iupper`.

The `index_map` describes the mapping of indexes 0, 1, and 2 on part `part` to the corresponding indexes on part `nbor_part`. For example, triple (1, 2, 0) means that indexes 0, 1, and 2 on part `part` map to indexes 1, 2, and 0 on part `nbor_part`, respectively.

The `index_dir` describes the direction of the mapping in `index_map`. For example, triple (1, 1, -1) means that for indexes 0 and 1, increasing values map to increasing values on `nbor_part`, while for index 2, decreasing values map to increasing values.

NOTE: All parts related to each other via this routine must have an identical list of variables and variable types. For example, if part 0 has only two variables on it, a cell centered variable and a node centered variable, and we declare part 1 to be a neighbor of part 0, then part 1 must also have only two variables on it, and they must be of type cell and node. In addition, variables associated with FACEs or EDGEs must be grouped together and listed in X, Y, Z order. This is to enable the code to correctly associate variables on one part with variables on its neighbor part when a coordinate transformation is specified. For example, an XFACE variable on one part may correspond to a YFACE variable on a neighbor part under a particular transformation, and the code determines this association by assuming that the variable lists are as noted here.

2.1.10

```c
int HYPRE_SStructGridSetSharedPart (HYPRE_SStructGrid grid, int part, int* ilower, int* iupper, int* offset, int shared_part, int* shared_ilower, int* shared_iupper, int* shared_offset, int* index_map, int* index_dir)
```

Describe how regions inside a part are shared with regions in other parts.

Parts `part` and `shared_part` must be different.

Indexes should increase from `ilower` to `iupper`. It is not necessary that indexes increase from `shared_ilower` to `shared_iupper`. This is to maintain consistency with the `SetNeighborPart` function, which is also able
to describe shared regions but in a more limited fashion.

The **offset** is a triple (in 3D) used to indicate the dimensionality of the shared set of data and its position with respect to the box extents \(i_{\text{lower}}\) and \(i_{\text{upper}}\) on part \(\text{part}\). The dimensionality is given by the number of 0’s in the triple, and the position is given by plus or minus 1’s. For example: \((0, 0, 0)\) indicates sharing of all data in the given box; \((1, 0, 0)\) indicates sharing of data on the faces in the \((1, 0, 0)\) direction; \((1, 0, -1)\) indicates sharing of data on the edges in the \((1, 0, -1)\) direction; and \((1, -1, 1)\) indicates sharing of data on the nodes in the \((1, -1, 1)\) direction. To ensure the dimensionality, it is required that for every nonzero entry, the corresponding extents of the box are the same. For example, if **offset** is \((0, 1, 0)\), then \((2, 1, 3)\) and \((10, 1, 15)\) are valid box extents, whereas \((2, 1, 3)\) and \((10, 7, 15)\) are invalid (because 1 and 7 are not the same).

The **shared_offset** is used in the same way as **offset**, but with respect to the box extents \(\text{shared}_{\text{ilower}}\) and \(\text{shared}_{\text{iupper}}\) on part \(\text{shared}_{\text{part}}\).

The **index_map** describes the mapping of indexes 0, 1, and 2 on part \(\text{part}\) to the corresponding indexes on part \(\text{shared}_{\text{part}}\). For example, triple \((1, 2, 0)\) means that indexes 0, 1, and 2 on part \(\text{part}\) map to indexes 1, 2, and 0 on part \(\text{shared}_{\text{part}}\), respectively.

The **index_dir** describes the direction of the mapping in **index_map**. For example, triple \((1, 1, -1)\) means that for indexes 0 and 1, increasing values map to increasing values on \(\text{shared}_{\text{part}}\), while for index 2, decreasing values map to increasing values.

**NOTE:** All parts related to each other via this routine must have an identical list of variables and variable types. For example, if part 0 has only two variables on it, a cell centered variable and a node centered variable, and we declare part 1 to have shared regions with part 0, then part 1 must also have only two variables on it, and they must be of type cell and node. In addition, variables associated with FACEs or EDGEs must be grouped together and listed in X, Y, Z order. This is to enable the code to correctly associate variables on one part with variables on a shared part when a coordinate transformation is specified. For example, an XFACE variable on one part may correspond to a YFACE variable on a shared part under a particular transformation, and the code determines this association by assuming that the variable lists are as noted here.

### 2.1.11

```c
int HYPRE_SStructGridAddUnstructuredPart (HYPRE_SStructGrid grid, int ilower, int iupper)
```

Add an unstructured part to the grid. The variables in the unstructured part of the grid are referenced by a global rank between 0 and the total number of unstructured variables minus one. Each process owns some unique consecutive range of variables, defined by \(i_{\text{lower}}\) and \(i_{\text{upper}}\).

**NOTE:** This is just a placeholder. This part of the interface is not finished.
2.1.12

```c
int HYPRE_SStructGridAssemble (HYPRE_SStructGrid grid)
```

Finalize the construction of the grid before using.

2.1.13

```c
int HYPRE_SStructGridSetPeriodic (HYPRE_SStructGrid grid, int part, int* periodic)
```

Set the periodicity on a particular part.

The argument `periodic` is an `ndim`-dimensional integer array that contains the periodicity for each dimension. A zero value for a dimension means non-periodic, while a nonzero value means periodic and contains the actual period. For example, periodicity in the first and third dimensions for a `10x11x12` part is indicated by the array `[10,0,12]`.

NOTE: Some of the solvers in hypre have power-of-two restrictions on the size of the periodic dimensions.

2.1.14

```c
int HYPRE_SStructGridSetNumGhost (HYPRE_SStructGrid grid, int* num_ghost)
```

Setting ghost in the sgrids.

2.2

**SStruct Stencils**

Names

2.2.1       typedef struct hypre_SStructStencil_struct *HYPRE_SStructStencil
The stencil object

2.2.2 int

HYPRE_SStructStencilCreate (int ndim, int size, HYPRE_SStructStencil* stencil)

Create a stencil object for the specified number of spatial dimensions and stencil entries

2.2.3 int

HYPRE_SStructStencilDestroy (HYPRE_SStructStencil stencil)

Destroy a stencil object

2.2.4 int

HYPRE_SStructStencilSetEntry (HYPRE_SStructStencil stencil, int entry, int* offset, int var)

Set a stencil entry

2.2.1
typedef struct hypre_SStructStencil struct *HYPRE_SStructStencil

The stencil object

Create a stencil object for the specified number of spatial dimensions and stencil entries

Destroy a stencil object
### 2.2.4

```c
int HYPRE_SStructStencilSetEntry (HYPRE_SStructStencil stencil, int entry, int* offset, int var)
```

Set a stencil entry

### 2.3

#### SStruct Graphs

#### Names

2.3.1 `typedef struct hypre_SStructGraph_struct *HYPRE_SStructGraph`

The graph object is used to describe the nonzero structure of a matrix . . . . 31

2.3.2 `int HYPRE_SStructGraphCreate (MPI_Comm comm, HYPRE_SStructGrid grid, HYPRE_SStructGraph* graph)`

Create a graph object ...................................................... 31

2.3.3 `int HYPRE_SStructGraphDestroy (HYPRE_SStructGraph graph)`

Destroy a graph object ...................................................... 31

2.3.4 `int HYPRE_SStructGraphSetDomainGrid (HYPRE_SStructGraph graph, HYPRE_SStructGrid domain_grid)`

Set the domain grid ......................................................... 32

2.3.5 `int HYPRE_SStructGraphSetStencil (HYPRE_SStructGraph graph, int part, int var, HYPRE_SStructStencil stencil)`

Set the stencil for a variable on a structured part of the grid .......... 32

2.3.6 `int HYPRE_SStructGraphSetFEM (HYPRE_SStructGraph graph, int part)`

Indicate that an FEM approach will be used to set matrix values on this part ................................................................. 32

2.3.7 `int HYPRE_SStructGraphSetFEMSparsity (HYPRE_SStructGraph graph, int part, int nsparse, int* sparsity)`

Set the finite element stiffness matrix sparsity. .......................... 32

2.3.8 `int`
typedef struct hypre_SStructGraph_struct *HYPRE_SStructGraph

The graph object is used to describe the nonzero structure of a matrix

Create a graph object

Destroy a graph object
2.3.4

```
int HYPRE_SStructGraphSetDomainGrid (HYPRE_SStructGraph graph,
                                    HYPRE_SStructGrid domain_grid)
```

Set the domain grid

2.3.5

```
int HYPRE_SStructGraphSetStencil (HYPRE_SStructGraph graph, int part, int
                                var, HYPRE_SStructStencil stencil)
```

Set the stencil for a variable on a structured part of the grid

2.3.6

```
int HYPRE_SStructGraphSetFEM (HYPRE_SStructGraph graph, int part)
```

Indicate that an FEM approach will be used to set matrix values on this part

2.3.7

```
int HYPRE_SStructGraphSetFEMSparsity (HYPRE_SStructGraph graph, int
                                    part, int nsparse, int* sparsity)
```

Set the finite element stiffness matrix sparsity. This overrides the default full sparsity pattern described below.

Array `sparsity` contains `nsparse` row/column tuples (I,J) that indicate the nonzeroes of the local stiffness matrix. The layout of the values passed into the routine `HYPRE_SStructMatrixAddFEMValues` is determined here.

The default sparsity is full (each variable is coupled to all others), and the values passed into the routine `HYPRE_SStructMatrixAddFEMValues` are assumed to be by rows (that is, column indices vary fastest).
### 2.3.8

```c
int HYPRE_SStructGraphAddEntries (HYPRE_SStructGraph graph, int part,
    int* index, int var, int to_part, int* to_index, int to_var)
```

Add a non-stencil graph entry at a particular index. This graph entry is appended to the existing graph entries, and is referenced as such.

**NOTE:** Users are required to set graph entries on all processes that own the associated variables. This means that some data will be multiply defined.

### 2.3.9

```c
int HYPRE_SStructGraphAssemble (HYPRE_SStructGraph graph)
```

Finalize the construction of the graph before using.

### 2.3.10

```c
int HYPRE_SStructGraphSetObjectType (HYPRE_SStructGraph graph, int type)
```

Set the storage type of the associated matrix object. It is used before AddEntries and Assemble to compute the right ranks in the graph.

**NOTE:** This routine is only necessary for implementation reasons, and will eventually be removed.

**See Also:** HYPRE_SStructMatrixSetObjectType (→2.4.16, page 44)

DOC++ is ©1995 by Roland Wunderling

Malte Zöckler
SStruct System Interface

2.4.11 int HYPRE_SStructMatrixAddToBoxValues (HYPRE_SStructMatrix matrix, int part, int* ilower, int* iupper, int var, int nentries, int* entries, double* values)

Add to matrix coefficients a box at a time.

2.4.12 int HYPRE_SStructMatrixGetBoxValues (HYPRE_SStructMatrix matrix, int part, int* ilower, int* iupper, int var, int nentries, int* entries, double* values)

Get matrix coefficients a box at a time.

2.4.13 int HYPRE_SStructMatrixAssemble (HYPRE_SStructMatrix matrix)

Finalize the construction of the matrix before using

2.4.14 int HYPRE_SStructMatrixSetSymmetric (HYPRE_SStructMatrix matrix, int part, int var, int to_var, int symmetric)

Define symmetry properties for the stencil entries in the matrix.

2.4.15 int HYPRE_SStructMatrixSetNSSymmetric (HYPRE_SStructMatrix matrix, int symmetric)

Define symmetry properties for all non-stencil matrix entries

2.4.16 int HYPRE_SStructMatrixSetObjectType (HYPRE_SStructMatrix matrix, int type)

Set the storage type of the matrix object to be constructed.

2.4.17 int HYPRE_SStructMatrixGetObject (HYPRE_SStructMatrix matrix, void** object)

Get a reference to the constructed matrix object.

2.4.18 int HYPRE_SStructMatrixSetComplex (HYPRE_SStructMatrix matrix)

Set the matrix to be complex

2.4.19 int HYPRE_SStructMatrixPrint (const char* filename, HYPRE_SStructMatrix matrix, int all)

Print the matrix to file.
2.4.1

typedef struct hypre_SStructMatrix_struct *HYPRE_SStructMatrix

The matrix object

2.4.2

int HYPRE_SStructMatrixCreate (MPI_Comm comm, HYPRE_SStructGraph graph, HYPRE_SStructMatrix* matrix)

Create a matrix object

2.4.3

int HYPRE_SStructMatrixDestroy (HYPRE_SStructMatrix matrix)

Destroy a matrix object

2.4.4

int HYPRE_SStructMatrixInitialize (HYPRE_SStructMatrix matrix)

Prepare a matrix object for setting coefficient values

2.4.5

int HYPRE_SStructMatrixSetValues (HYPRE_SStructMatrix matrix, int part, int* index, int var, int nentries, int* entries, double* values)
Set matrix coefficients index by index. The values array is of length nentries.

NOTE: For better efficiency, use HYPRE_SStructMatrixSetBoxValues to set coefficients a box at a time.

NOTE: Users are required to set values on all processes that own the associated variables. This means that some data will be multiply defined.

NOTE: The entries in this routine must all be of the same type: either stencil or non-stencil, but not both. Also, if they are stencil entries, they must all represent couplings to the same variable type (there are no such restrictions for non-stencil entries).

If the matrix is complex, then values consists of pairs of doubles representing the real and imaginary parts of each complex value.

See Also: HYPRE_SStructMatrixSetComplex (→2.4.18, page 42)

2.4.6

```c
int
HYPRE_SStructMatrixAddToValues (HYPRE_SStructMatrix matrix, int part, int* index, int var, int nentries, int* entries, double* values)
```

Add to matrix coefficients index by index. The values array is of length nentries.

NOTE: For better efficiency, use HYPRE_SStructMatrixAddToBoxValues to set coefficients a box at a time.

NOTE: Users are required to set values on all processes that own the associated variables. This means that some data will be multiply defined.

NOTE: The entries in this routine must all be of the same type: either stencil or non-stencil, but not both. Also, if they are stencil entries, they must all represent couplings to the same variable type.

If the matrix is complex, then values consists of pairs of doubles representing the real and imaginary parts of each complex value.

See Also: HYPRE_SStructMatrixSetComplex (→2.4.18, page 42)

2.4.7

```c
int
HYPRE_SStructMatrixAddFEMValues (HYPRE_SStructMatrix matrix, int part, int* index, double* values)
```
Add finite element stiffness matrix coefficients index by index. The layout of the data in \texttt{values} is determined by the routines \texttt{HYPRE_SStructGridSetFEMOrdering} and \texttt{HYPRE_SStructGraphSetFEMSparsity} (\rightarrow 2.3.6, page 32).

If the matrix is complex, then \texttt{values} consists of pairs of doubles representing the real and imaginary parts of each complex value.

\textbf{See Also:} \texttt{HYPRE_SStructMatrixSetComplex} (\rightarrow 2.4.18, page 42)

\begin{verbatim}
2.4.8

int
HYPRE_SStructMatrixGetValues (HYPRE_SStructMatrix matrix, int part,
int* index, int var, int nentries, int* entries, double* values)

Get matrix coefficients index by index. The \texttt{values} array is of length \texttt{nentries}.

NOTE: For better efficiency, use \texttt{HYPRE_SStructMatrixGetBoxValues} to get coefficients a box at a time.

NOTE: Users may get values on any process that owns the associated variables.

NOTE: The entries in this routine must all be of the same type: either stencil or non-stencil, but not both. Also, if they are stencil entries, they must all represent couplings to the same variable type (there are no such restrictions for non-stencil entries).

If the matrix is complex, then \texttt{values} consists of pairs of doubles representing the real and imaginary parts of each complex value.

\textbf{See Also:} \texttt{HYPRE_SStructMatrixSetComplex} (\rightarrow 2.4.18, page 42)

\end{verbatim}

\begin{verbatim}
2.4.9

int
HYPRE_SStructMatrixGetFEMValues (HYPRE_SStructMatrix matrix, int part,
int* index, double* values)

Get finite element stiffness matrix coefficients index by index. The layout of the data in \texttt{values} is determined by the routines \texttt{HYPRE_SStructGridSetFEMOrdering} and \texttt{HYPRE_SStructGraphSetFEMSparsity} (\rightarrow 2.3.6, page 32).

If the matrix is complex, then \texttt{values} consists of pairs of doubles representing the real and imaginary parts of each complex value.

\textbf{See Also:} \texttt{HYPRE_SStructMatrixSetComplex} (\rightarrow 2.4.18, page 42)

\end{verbatim}
2.4.10

```c
int HYPRE_SStructMatrixSetBoxValues (HYPRE_SStructMatrix matrix, int part, int* ilower, int* iupper, int var, int nentries, int* entries, double* values)
```

Set matrix coefficients a box at a time. The data in `values` is ordered as follows:

```c
m = 0;
for (k = ilower[2]; k <= iupper[2]; k++)
    for (j = ilower[1]; j <= iupper[1]; j++)
        for (i = ilower[0]; i <= iupper[0]; i++)
            for (entry = 0; entry < nentries; entry++)
                { 
                    values[m] = ...;
                    m++;
                }
```

NOTE: Users are required to set values on all processes that own the associated variables. This means that some data will be multiply defined.

NOTE: The entries in this routine must all be of the same type: either stencil or non-stencil, but not both. Also, if they are stencil entries, they must all represent couplings to the same variable type (there are no such restrictions for non-stencil entries).

If the matrix is complex, then `values` consists of pairs of doubles representing the real and imaginary parts of each complex value.

See Also: `HYPRE_SStructMatrixSetComplex` (→2.4.18, page 42)

2.4.11

```c
int HYPRE_SStructMatrixAddToBoxValues (HYPRE_SStructMatrix matrix, int part, int* ilower, int* iupper, int var, int nentries, int* entries, double* values)
```

Add to matrix coefficients a box at a time. The data in `values` is ordered as in `HYPRE_SStructMatrixSetBoxValues`.

See Also: `HYPRE_SStructMatrixSetComplex` (→2.4.18, page 42)
NOTE: Users are required to set values on all processes that own the associated variables. This means that some data will be multiply defined.

NOTE: The entries in this routine must all be of stencil type. Also, they must all represent couplings to the same variable type.

If the matrix is complex, then values consists of pairs of doubles representing the real and imaginary parts of each complex value.

See Also: HYPRE_SStructMatrixSetComplex (→2.4.18, page 42)

### 2.4.12

```c
int HYPRE_SStructMatrixGetBoxValues (HYPRE_SStructMatrix matrix, int part, int* ilower, int* iupper, int var, int nentries, int* entries, double* values)
```

Get matrix coefficients a box at a time. The data in values is ordered as in HYPRE_SStructMatrixSetBoxValues.

NOTE: Users may get values on any process that owns the associated variables.

NOTE: The entries in this routine must all be of stencil type. Also, they must all represent couplings to the same variable type.

If the matrix is complex, then values consists of pairs of doubles representing the real and imaginary parts of each complex value.

See Also: HYPRE_SStructMatrixSetComplex (→2.4.18, page 42)

### 2.4.13

```c
int HYPRE_SStructMatrixAssemble (HYPRE_SStructMatrix matrix)
```

Finalize the construction of the matrix before using
### 2.4.14

```c
int HYPRE_SStructMatrixSetSymmetric (HYPRE_SStructMatrix matrix, int part, int var, int to_var, int symmetric)
```

Define symmetry properties for the stencil entries in the matrix. The boolean argument `symmetric` is applied to stencil entries on part `part` that couple variable `var` to variable `to_var`. A value of -1 may be used for `part`, `var`, or `to_var` to specify “all”. For example, if `part` and `to_var` are set to -1, then the boolean is applied to stencil entries on all parts that couple variable `var` to all other variables.

By default, matrices are assumed to be nonsymmetric. Significant storage savings can be made if the matrix is symmetric.

### 2.4.15

```c
int HYPRE_SStructMatrixSetNSSymmetric (HYPRE_SStructMatrix matrix, int symmetric)
```

Define symmetry properties for all non-stencil matrix entries.

### 2.4.16

```c
int HYPRE_SStructMatrixSetObjectType (HYPRE_SStructMatrix matrix, int type)
```

Set the storage type of the matrix object to be constructed. Currently, `type` can be either `HYPRE_SSTRUCT` (the default), `HYPRE_STRUCT`, or `HYPRE_PARCSR`.

**See Also:**

`HYPRE_SStructMatrixGetObject (→2.4.17, page 42)`
Get a reference to the constructed matrix object.

See Also: HYPRE_SStructMatrixSetObjectType (→2.4.16, page 44)

Set the matrix to be complex

Print the matrix to file. This is mainly for debugging purposes.

2.5.1

typedef struct hypre_SStructVector struct *HYPRE_SStructVector

The vector object

2.5.2

int

**HYPRE_SStructVectorCreate** (MPI_Comm comm, HYPRE_SStructGrid grid, HYPRE_SStructVector* vector)

Create a vector object

2.5.3

int **HYPRE_SStructVectorDestroy** (HYPRE_SStructVector vector)
Destroy a vector object

2.5.4

int HYPRE_SStructVectorInitialize (HYPRE_SStructVector vector)

Prepare a vector object for setting coefficient values

2.5.5

int HYPRE_SStructVectorSetValues (HYPRE_SStructVector vector, int part, int* index, int var, double* value)

Set vector coefficients index by index.

NOTE: For better efficiency, use HYPRE_SStructVectorSetBoxValues to set coefficients a box at a time.

NOTE: Users are required to set values on all processes that own the associated variables. This means that some data will be multiply defined.

If the vector is complex, then value consists of a pair of doubles representing the real and imaginary parts of the complex value.

See Also: HYPRE_SStructVectorSetComplex (→2.5.17, page 49)

2.5.6

int HYPRE_SStructVectorAddToValues (HYPRE_SStructVector vector, int part, int* index, int var, double* value)

Add to vector coefficients index by index.

NOTE: For better efficiency, use HYPRE_SStructVectorAddToBoxValues to set coefficients a box at a time.

NOTE: Users are required to set values on all processes that own the associated variables. This means that some data will be multiply defined.
If the vector is complex, then `value` consists of a pair of doubles representing the real and imaginary parts of the complex value.

**See Also:**

HYPRE_SStructVectorSetComplex (→2.5.17, page [49](#))

---

### 2.5.7

```c
int
HYPRE_SStructVectorAddFEMValues (HYPRE_SStructVector vector, int part, int* index, double* values)
```

Add finite element vector coefficients index by index. The layout of the data in `values` is determined by the routine HYPRE_SStructGridSetFEMOrdering.

If the vector is complex, then `values` consists of pairs of doubles representing the real and imaginary parts of each complex value.

**See Also:**

HYPRE_SStructVectorSetComplex (→2.5.17, page [49](#))

---

### 2.5.8

```c
int
HYPRE_SStructVectorGetValues (HYPRE_SStructVector vector, int part, int* index, int var, double* value)
```

Get vector coefficients index by index. Users must first call the routine HYPRE_SStructVectorGather to ensure that data owned by multiple processes is correct.

NOTE: For better efficiency, use HYPRE_SStructVectorGetBoxValues to get coefficients a box at a time.

NOTE: Users may only get values on processes that own the associated variables.

If the vector is complex, then `value` consists of a pair of doubles representing the real and imaginary parts of the complex value.

**See Also:**

HYPRE_SStructVectorSetComplex (→2.5.17, page [49](#))
2.5.9

```c
int HYPRE_SStructVectorGetFEMValues (HYPRE_SStructVector vector, int part, int* index, double* values)
```

Get finite element vector coefficients index by index. The layout of the data in `values` is determined by the routine `HYPRE_SStructGridSetFEMOrdering`. Users must first call the routine `HYPRE_SStructVectorGather` to ensure that data owned by multiple processes is correct.

If the vector is complex, then `values` consists of pairs of doubles representing the real and imaginary parts of each complex value.

**See Also:** `HYPRE_SStructVectorSetComplex` (→2.5.17, page 49)

2.5.10

```c
int HYPRE_SStructVectorSetBoxValues (HYPRE_SStructVector vector, int part, int* ilower, int* iupper, int var, double* values)
```

Set vector coefficients a box at a time. The data in `values` is ordered as follows:

```c
m = 0;
for (k = ilower[2]; k <= iupper[2]; k++)
  for (j = ilower[1]; j <= iupper[1]; j++)
    for (i = ilower[0]; i <= iupper[0]; i++)
      {
        values[m] = ...;
        m++;
      }
```

NOTE: Users are required to set values on all processes that own the associated variables. This means that some data will be multiply defined.

If the vector is complex, then `values` consists of pairs of doubles representing the real and imaginary parts of each complex value.

**See Also:** `HYPRE_SStructVectorSetComplex` (→2.5.17, page 49)
Add to vector coefficients a box at a time. The data in `values` is ordered as in `HYPRE_SStructVectorSetBoxValues`.

NOTE: Users are required to set values on all processes that own the associated variables. This means that some data will be multiply defined.

If the vector is complex, then `values` consists of pairs of doubles representing the real and imaginary parts of each complex value.

See Also: `HYPRE_SStructVectorSetComplex` (→2.5.17, page 49)

Get vector coefficients a box at a time. The data in `values` is ordered as in `HYPRE_SStructVectorSetBoxValues`. Users must first call the routine `HYPRE_SStructVectorGather` to ensure that data owned by multiple processes is correct.

NOTE: Users may only get values on processes that own the associated variables.

If the vector is complex, then `values` consists of pairs of doubles representing the real and imaginary parts of each complex value.

See Also: `HYPRE_SStructVectorSetComplex` (→2.5.17, page 49)

Finalize the construction of the vector before using
### 2.5.14

```c
int HYPRE_SStructVectorGather (HYPRE_SStructVector vector)
```

Gather vector data so that efficient `GetValues` can be done. This routine must be called prior to calling `GetValues` to ensure that correct and consistent values are returned, especially for non cell-centered data that is shared between more than one processor.

### 2.5.15

```c
int HYPRE_SStructVectorSetObjectType (HYPRE_SStructVector vector, int type)
```

Set the storage type of the vector object to be constructed. Currently, `type` can be either `HYPRE_SSTRUCT` (the default), `HYPRE_STRUCT`, or `HYPRE_PARCSR`.

**See Also:** `HYPRE_SStructVectorGetObject` (→2.5.16, page 49)

### 2.5.16

```c
int HYPRE_SStructVectorGetObject (HYPRE_SStructVector vector, void** object)
```

Get a reference to the constructed vector object.

**See Also:** `HYPRE_SStructVectorSetObjectType` (→2.5.15, page 49)

### 2.5.17

```c
int HYPRE_SStructVectorSetComplex (HYPRE_SStructVector vector)
```

Set the vector to be complex
2.5.18

```c
int HYPRE_SStructVectorPrint (const char* filename, HYPRE_SStructVector vector, int all)
```

Print the vector to file. This is mainly for debugging purposes.
This interface represents a linear-algebraic conceptual view of a linear system. The 'I' and 'J' in the name are meant to be mnemonic for the traditional matrix notation A(I,J).

### 3.1 IJ Matrices

**Names**

3.1.1 `typedef struct hypre_IJMatrix_struct *HYPRE_IJMatrix`  
*The matrix object* ............................... 53

3.1.2 `int HYPRE_IJMatrixCreate (MPI_Comm comm, int ilower, int iupper, int jlower, int jupper, HYPRE_IJMatrix* matrix)`  
*Create a matrix object.* ........................... 53

3.1.3 `int HYPRE_IJMatrixDestroy (HYPRE_IJMatrix matrix)`  
*Destroy a matrix object.* ........................... 53

3.1.4 `int HYPRE_IJMatrixInitialize (HYPRE_IJMatrix matrix)`  
*Prepare a matrix object for setting coefficient values.* ........................... 54

3.1.5 `int HYPRE_IJMatrixSetValues (HYPRE_IJMatrix matrix, int nrows, int* ncols, const int* rows, const int* cols, const double* values)`  
*Sets values for nrows rows or partial rows of the matrix.* ........................... 54

3.1.6 `int HYPRE_IJMatrixAddToValues (HYPRE_IJMatrix matrix, int nrows, int* ncols, const int* rows, const int* cols, const double* values)`  
*Adds to values for nrows rows or partial rows of the matrix.* ........................... 54
3.1.8 int HYPRE_IJMatrixGetRowCounts (HYPRE_IJMatrix matrix, int nrows, int* rows, int* ncols)
Gets number of nonzeros elements for nrows rows specified in rows and returns them in ncols, which needs to be allocated by the user .........

3.1.9 int HYPRE_IJMatrixGetValues (HYPRE_IJMatrix matrix, int nrows, int* ncols, int* rows, int* cols, double* values)
Gets values for nrows rows or partial rows of the matrix. .............

3.1.10 int HYPRE_IJMatrixSetObjectType (HYPRE_IJMatrix matrix, int type)
Set the storage type of the matrix object to be constructed. ............

3.1.11 int HYPRE_IJMatrixGetObjectType (HYPRE_IJMatrix matrix, int* type)
Get the storage type of the constructed matrix object .....................

3.1.12 int HYPRE_IJMatrixGetLocalRange (HYPRE_IJMatrix matrix, int* ilower, int* iupper, int* jlower, int* jupper)
Gets range of rows owned by this processor and range of column partitioning for this processor ..............................................

3.1.13 int HYPRE_IJMatrixGetObject (HYPRE_IJMatrix matrix, void** object)
Get a reference to the constructed matrix object. .........................

3.1.14 int HYPRE_IJMatrixSetRowSizes (HYPRE_IJMatrix matrix, const int* sizes)
(Optional) Set the max number of nonzeros to expect in each row. ......

3.1.15 int HYPRE_IJMatrixSetDiagOffdSizes (HYPRE_IJMatrix matrix, const int* diag_sizes, const int* offdiag_sizes)
(Optional) Set the max number of nonzeros to expect in each row of the diagonal and off-diagonal blocks. ..............................

3.1.16 int HYPRE_IJMatrixSetMaxOffProcElmts (HYPRE_IJMatrix matrix, int max_off_proc_elmts)
(Optional) Sets the maximum number of elements that are expected to be set (or added) on other processors from this processor. This routine can significantly improve the efficiency of matrix construction, and should always be utilized if possible. ..................................................

3.1.17 int HYPRE_IJMatrixSetPrintLevel (HYPRE_IJMatrix matrix, int print_level)
(Optional) Sets the print level, if the user wants to print error messages.

3.1.18 int HYPRE_IJMatrixRead (const char* filename, MPI_Comm comm, int type, HYPRE_IJMatrix* matrix)
Read the matrix from file. .................................................
HYPRE_IJMatrixPrint (HYPRE_IJMatrix matrix, const char* filename)

Print the matrix to file. ..............................................

3.1.1

typedef struct hypre_IJMatrix_struct *HYPRE_IJMatrix

The matrix object

3.1.2

int HYPRE_IJMatrixCreate (MPI_Comm comm, int ilower, int iupper, int jlower, int jupper, HYPRE_IJMatrix* matrix)

Create a matrix object. Each process owns some unique consecutive range of rows, indicated by the global row indices ilower and iupper. The row data is required to be such that the value of ilower on any process p be exactly one more than the value of iupper on process p − 1. Note that the first row of the global matrix may start with any integer value. In particular, one may use zero- or one-based indexing.

For square matrices, jlower and jupper typically should match ilower and iupper, respectively. For rectangular matrices, jlower and jupper should define a partitioning of the columns. This partitioning must be used for any vector v that will be used in matrix-vector products with the rectangular matrix. The matrix data structure may use jlower and jupper to store the diagonal blocks (rectangular in general) of the matrix separately from the rest of the matrix.

Collective.

3.1.3

int HYPRE_IJMatrixDestroy (HYPRE_IJMatrix matrix)

Destroy a matrix object. An object should be explicitly destroyed using this destructor when the user’s code no longer needs direct access to it. Once destroyed, the object must not be referenced again. Note that the object may not be deallocated at the completion of this call, since there may be internal package references to the object. The object will then be destroyed when all internal reference counts go to zero.
### 3.1.4

```c
int HYPRE_IJMatrixInitialize (HYPRE_IJMatrix matrix)
```

Prepare a matrix object for setting coefficient values. This routine will also re-initialize an already assembled matrix, allowing users to modify coefficient values.

### 3.1.5

```c
int HYPRE_IJMatrixSetValue (HYPRE_IJMatrix matrix, int nrows, int* ncols,
                           const int* rows, const int* cols, const double* values)
```

Sets values for `nrows` rows or partial rows of the matrix. The arrays `ncols` and `rows` are of dimension `nrows` and contain the number of columns in each row and the row indices, respectively. The array `cols` contains the column indices for each of the `rows`, and is ordered by rows. The data in the `values` array corresponds directly to the column entries in `cols`. Erases any previous values at the specified locations and replaces them with new ones, or, if there was no value there before, inserts a new one if set locally. Note that it is not possible to set values on other processors. If one tries to set a value from proc i on proc j, proc i will erase all previous occurrences of this value in its stack (including values generated with `AddToValues`), and treat it like a zero value. The actual value needs to be set on proc j.

Not collective.

### 3.1.6

```c
int HYPRE_IJMatrixAddToValues (HYPRE_IJMatrix matrix, int nrows, int* ncols,
                                const int* rows, const int* cols, const double* values)
```

Adds to values for `nrows` rows or partial rows of the matrix. Usage details are analogous to `HYPRE_IJMatrixSetValues`. Adds to any previous values at the specified locations, or, if there was no value there before, inserts a new one. `AddToValues` can be used to add to values on other processors.

Not collective.
3.1.7

```c
int HYPRE_IJMatrixAssemble (HYPRE_IJMatrix matrix)
```

Finalize the construction of the matrix before using.

3.1.8

```c
int HYPRE_IJMatrixGetRowCounts (HYPRE_IJMatrix matrix, int nrows, int* rows, int* ncols)
```

Gets number of nonzeros elements for `nrows` rows specified in `rows` and returns them in `ncols`, which needs to be allocated by the user.

3.1.9

```c
int HYPRE_IJMatrixGetValues (HYPRE_IJMatrix matrix, int nrows, int* ncols, int* rows, int* cols, double* values)
```

Gets values for `nrows` rows or partial rows of the matrix. Usage details are analogous to `HYPRE_IJMatrixSetValues`.

3.1.10

```c
int HYPRE_IJMatrixSetObjectType (HYPRE_IJMatrix matrix, int type)
```

Set the storage type of the matrix object to be constructed. Currently, `type` can only be `HYPRE_PARCSR`.

Not collective, but must be the same on all processes.
See Also: HYPRE_IJMatrixGetObject (→3.1.13, page 56)

3.1.11

int HYPRE_IJMatrixGetObjectType (HYPRE_IJMatrix matrix, int* type)

Get the storage type of the constructed matrix object

3.1.12

int HYPRE_IJMatrixGetLocalRange (HYPRE_IJMatrix matrix, int* ilower, int* iupper, int* jlower, int* jupper)

Gets range of rows owned by this processor and range of column partitioning for this processor

3.1.13

int HYPRE_IJMatrixGetObject (HYPRE_IJMatrix matrix, void** object)

Get a reference to the constructed matrix object.

See Also: HYPRE_IJMatrixSetObjectType (→3.1.10, page 55)

3.1.14

int HYPRE_IJMatrixSetRowSizes (HYPRE_IJMatrix matrix, const int* sizes)

(Optional) Set the max number of nonzeros to expect in each row. The array sizes contains estimated sizes for each row on this process. This call can significantly improve the efficiency of matrix construction, and should always be utilized if possible.

Not collective.
3.1.15

```
int HYPRE_IJMatrixSetDiagOffdSizes (HYPRE_IJMatrix matrix, const int* diag_sizes, const int* offdiag_sizes)
```

(Optional) Set the max number of nonzeros to expect in each row of the diagonal and off-diagonal blocks. The diagonal block is the submatrix whose column numbers correspond to rows owned by this process, and the off-diagonal block is everything else. The arrays `diag_sizes` and `offdiag_sizes` contain estimated sizes for each row of the diagonal and off-diagonal blocks, respectively. This routine can significantly improve the efficiency of matrix construction, and should always be utilized if possible.

Not collective.

3.1.16

```
int HYPRE_IJMatrixSetMaxOffProcElmts (HYPRE_IJMatrix matrix, int max_off_proc_elmts)
```

(Optional) Sets the maximum number of elements that are expected to be set (or added) on other processors from this processor. This routine can significantly improve the efficiency of matrix construction, and should always be utilized if possible.

Not collective.

3.1.17

```
int HYPRE_IJMatrixSetPrintLevel (HYPRE_IJMatrix matrix, int print_level)
```

(Optional) Sets the print level, if the user wants to print error messages. The default is 0, i.e. no error messages are printed.
3.1.18

```c
int HYPRE_IJMatrixRead (const char* filename, MPI_Comm comm, int type, HYPRE_IJMatrix* matrix)
```

Read the matrix from file. This is mainly for debugging purposes.

3.1.19

```c
int HYPRE_IJMatrixPrint (HYPRE_IJMatrix matrix, const char* filename)
```

Print the matrix to file. This is mainly for debugging purposes.

3.2

**IJ Vectors**

### Names

3.2.1

typedef struct _hypre_IJVector_struct *HYPRE_IJVector

*The vector object*

-------------

3.2.2

```c
int HYPRE_IJVectorCreate (MPI_Comm comm, int jlower, int jupper, HYPRE_IJVector* vector)
```

*Create a vector object.*

-------------

3.2.3

```c
int HYPRE_IJVectorDestroy (HYPRE_IJVector vector)
```

*Destroy a vector object.*

-------------

3.2.4

```c

```

*Prepare a vector object for setting coefficient values.*

-------------

3.2.5

```c
int HYPRE_IJVectorSetMaxOffProcElmts (HYPRE_IJVector vector, int max_off_proc_elmts)
```

*(Optional) Sets the maximum number of elements that are expected to be set (or added) on other processors from this processor. This routine can significantly improve the efficiency of matrix construction, and should always be utilized if possible.*

-------------

3.2.6

```c
int
```
HIJ System Interface

### 3.2.1

typedef struct hypre_IJVector struct *HYPRE_IJVector

The vector object
3.2.2

```c
int HYPRE_IJVectorCreate (MPI_Comm comm, int jlower, int jupper, HYPRE_IJVector* vector)
```

Create a vector object. Each process owns some unique consecutive range of vector unknowns, indicated by the global indices `jlower` and `jupper`. The data is required to be such that the value of `jlower` on any process `p` be exactly one more than the value of `jupper` on process `p-1`. Note that the first index of the global vector may start with any integer value. In particular, one may use zero- or one-based indexing.

Collective.

3.2.3

```c
int HYPRE_IJVectorDestroy (HYPRE_IJVector vector)
```

Destroy a vector object. An object should be explicitly destroyed using this destructor when the user’s code no longer needs direct access to it. Once destroyed, the object must not be referenced again. Note that the object may not be deallocated at the completion of this call, since there may be internal package references to the object. The object will then be destroyed when all internal reference counts go to zero.

3.2.4

```c
int HYPRE_IJVectorInitialize (HYPRE_IJVector vector)
```

Prepare a vector object for setting coefficient values. This routine will also re-initialize an already assembled vector, allowing users to modify coefficient values.

3.2.5

```c
int HYPRE_IJVectorSetMaxOffProcElmts (HYPRE_IJVector vector, int max_off_proc_elmts)
```

(Optional) Sets the maximum number of elements that are expected to be set (or added) on other processors from this processor. This routine can significantly improve the efficiency of matrix construction, and should always be utilized if possible.

Not collective.

### 3.2.6

```c
int HYPRE_IJVectorSetValues (HYPRE_IJVector vector, int nvalues, const int* indices, const double* values)
```

Sets values in vector. The arrays `values` and `indices` are of dimension `nvalues` and contain the vector values to be set and the corresponding global vector indices, respectively. Erases any previous values at the specified locations and replaces them with new ones. Note that it is not possible to set values on other processors. If one tries to set a value from proc i on proc j, proc i will erase all previous occurrences of this value in its stack (including values generated with AddToValues), and treat it like a zero value. The actual value needs to be set on proc j.

Not collective.

### 3.2.7

```c
int HYPRE_IJVectorAddToValues (HYPRE_IJVector vector, int nvalues, const int* indices, const double* values)
```

Adds to values in vector. Usage details are analogous to `HYPRE_IJVectorSetValues`. Adds to any previous values at the specified locations, or, if there was no value there before, inserts a new one. AddToValues can be used to add to values on other processors.

Not collective.

### 3.2.8

```c
int HYPRE_IJVectorAssemble (HYPRE_IJVector vector)
```

Finalize the construction of the vector before using...
3.2.9

```c
int HYPRE_IJVectorGetValues (HYPRE_IJVector vector, int nvalues, const int* indices, double* values)
```

Gets values in vector. Usage details are analogous to HYPRE_IJVectorSetValues.

Not collective.

3.2.10

```c
int HYPRE_IJVectorSetObjectType (HYPRE_IJVector vector, int type)
```

Set the storage type of the vector object to be constructed. Currently, `type` can only be `HYPRE_PARCSR`.

Not collective, but must be the same on all processes.

**See Also:** HYPRE_IJVectorGetObject (→3.2.13, page 63)

3.2.11

```c
int HYPRE_IJVectorGetObjectType (HYPRE_IJVector vector, int* type)
```

Get the storage type of the constructed vector object

3.2.12

```c
int HYPRE_IJVectorGetLocalRange (HYPRE_IJVector vector, int* jlower, int* jupper)
```

Returns range of the part of the vector owned by this processor
3.2.13

```c
int HYPRE_IJVectorGetObject (HYPRE_IJVector vector, void** object)
```

Get a reference to the constructed vector object.

**See Also:**

HYPRE_IJVectorSetObjectType (→3.2.10, page 62)

3.2.14

```c
int HYPRE_IJVectorSetPrintLevel (HYPRE_IJVector vector, int print_level)
```

(Optional) Sets the print level, if the user wants to print error messages. The default is 0, i.e. no error messages are printed.

3.2.15

```c
int HYPRE_IJVectorRead (const char* filename, MPI_Comm comm, int type,
                        HYPRE_IJVector* vector)
```

Read the vector from file. This is mainly for debugging purposes.

3.2.16

```c
int HYPRE_IJVectorPrint (HYPRE_IJVector vector, const char* filename)
```

Print the vector to file. This is mainly for debugging purposes.
These solvers use matrix/vector storage schemes that are tailored to structured grid problems.
4.1.1

typedef struct hypre_StructSolver_struct *HYPRE_StructSolver

The solver object

4.2

Struct Jacobi Solver

Names

4.2.1

int HYPRE_StructJacobiCreate (MPI_Comm comm,
    HYPRE_StructSolver* solver)

Create a solver object

4.2.2

int HYPRE_StructJacobiDestroy (HYPRE_StructSolver solver)

Destroy a solver object.

4.2.3

int HYPRE_StructJacobiSetup (HYPRE_StructSolver solver,
    HYPRE_StructMatrix A,
    HYPRE_StructVector b,
    HYPRE_StructVector x)

Prepare to solve the system.

4.2.4

int HYPRE_StructJacobiSolve (HYPRE_StructSolver solver,
    HYPRE_StructMatrix A,
    HYPRE_StructVector b,
    HYPRE_StructVector x)

Solve the system

4.2.5

int HYPRE_StructJacobiSetTol (HYPRE_StructSolver solver, double tol)

(Optional) Set the convergence tolerance

4.2.6

int HYPRE_StructJacobiSetMaxIter (HYPRE_StructSolver solver, int max_iter)

(Optional) Set maximum number of iterations

4.2.7

int HYPRE_StructJacobiSetZeroGuess (HYPRE_StructSolver solver)

(Optional) Use a zero initial guess

4.2.8

int HYPRE_StructJacobiSetNonZeroGuess (HYPRE_StructSolver solver)

(Optional) Use a nonzero initial guess
4.2.1

int HYPRE_StructJacobiCreate (MPI_Comm comm, HYPRE_StructSolver* solver)

Create a solver object.

4.2.2

int HYPRE_StructJacobiDestroy (HYPRE_StructSolver solver)

Destroy a solver object. An object should be explicitly destroyed using this destructor when the user’s code no longer needs direct access to it. Once destroyed, the object must not be referenced again. Note that the object may not be deallocated at the completion of this call, since there may be internal package references to the object. The object will then be destroyed when all internal reference counts go to zero.

4.2.3

int HYPRE_StructJacobiSetup (HYPRE_StructSolver solver, HYPRE_StructMatrix A, HYPRE_StructVector b, HYPRE_StructVector x)

Prepare to solve the system. The coefficient data in b and x is ignored here, but information about the layout of the data may be used.
4.2.4

```c
int HYPRE_StructJacobiSolve (HYPRE_StructSolver solver, HYPRE_StructMatrix A, HYPRE_StructVector b, HYPRE_StructVector x)
```

Solve the system

4.2.5

```c
int HYPRE_StructJacobiSetTol (HYPRE_StructSolver solver, double tol)
```

(Optional) Set the convergence tolerance

4.2.6

```c
int HYPRE_StructJacobiSetMaxIter (HYPRE_StructSolver solver, int max_iter)
```

(Optional) Set maximum number of iterations

4.2.7

```c
int HYPRE_StructJacobiSetZeroGuess (HYPRE_StructSolver solver)
```

(Optional) Use a zero initial guess. This allows the solver to cut corners in the case where a zero initial guess is needed (e.g., for preconditioning) to reduce computational cost.
4.2.8

```
int HYPRE_StructJacobiSetNonZeroGuess (HYPRE_StructSolver solver)
```

(Optional) Use a nonzero initial guess. This is the default behavior, but this routine allows the user to switch back after using `SetZeroGuess`.

4.2.9

```
int HYPRE_StructJacobiGetNumIterations (HYPRE_StructSolver solver, int* num_iterations)
```

Return the number of iterations taken

4.2.10

```
int HYPRE_StructJacobiGetFinalRelativeResidualNorm (HYPRE_StructSolver solver, double* norm)
```

Return the norm of the final relative residual

4.3

**Struct PFMG Solver**

**Names**

4.3.1

```
int HYPRE_StructPFMGCreate (MPI_Comm comm,
                           HYPRE_StructSolver* solver)
```

Create a solver object

4.3.2

```
int HYPRE_StructPFMGMsDestroy (HYPRE_StructSolver solver)
```

Destroy a solver object
**HYPRE_StructPFMGSetup** (HYPRE_StructSolver solver,
HYPRE_StructMatrix A,
HYPRE_StructVector b,
HYPRE_StructVector x)

*Prepare to solve the system.* ................................. 71

4.3.13 int **HYPRE_StructPFMGSetNumPreRelax** (HYPRE_StructSolver solver,
int num_pre_relax)

*(Optional) Set number of relaxation sweeps before coarse-grid correction* .... 73

4.3.14 int
PFMG is a semicoarsening multigrid solver that uses pointwise relaxation. For periodic problems, users should try to set the grid size in periodic dimensions to be as close to a power-of-two as possible. That is, if the grid size in a periodic dimension is given by \( N = 2^m \times M \) where \( M \) is not a power-of-two, then \( M \) should be as small as possible. Large values of \( M \) will generally result in slower convergence rates.

**4.3.1**

```c
int HYPRE_StructPFMGCreate (MPI_Comm comm, HYPRE_StructSolver* solver)
```

Create a solver object.

**4.3.2**

```c
int HYPRE_StructPFMGMDestroy (HYPRE_StructSolver solver)
```
Destroy a solver object

4.3.3

```c
int HYPRE_StructPFMGSsetup (HYPRE_StructSolver solver,
                           HYPRE_StructMatrix A, HYPRE_StructVector b, HYPRE_StructVector x)
```

Prepare to solve the system. The coefficient data in $b$ and $x$ is ignored here, but information about the layout of the data may be used.

4.3.4

```c
int HYPRE_StructPFMGSolve (HYPRE_StructSolver solver,
                          HYPRE_StructMatrix A, HYPRE_StructVector b, HYPRE_StructVector x)
```

Solve the system

4.3.5

```c
int HYPRE_StructPFMGSsetTol (HYPRE_StructSolver solver, double tol)
```

(Optional) Set the convergence tolerance

4.3.6

```c
int HYPRE_StructPFMGSsetMaxIter (HYPRE_StructSolver solver, int max_iter)
```

(Optional) Set maximum number of iterations
4.3.7

```c
int HYPRE_StructPFMGSetAddressMaxLevels (HYPRE_StructSolver solver, int max_levels)
```

(Optional) Set maximum number of multigrid grid levels

4.3.8

```c
int HYPRE_StructPFMGSetAddressRelChange (HYPRE_StructSolver solver, int rel_change)
```

(Optional) Additionally require that the relative difference in successive iterates be small

4.3.9

```c
int HYPRE_StructPFMGSetAddressZeroGuess (HYPRE_StructSolver solver)
```

(Optional) Use a zero initial guess. This allows the solver to cut corners in the case where a zero initial guess is needed (e.g., for preconditioning) to reduce computational cost.

4.3.10

```c
int HYPRE_StructPFMGSetAddressNonZeroGuess (HYPRE_StructSolver solver)
```

(Optional) Use a nonzero initial guess. This is the default behavior, but this routine allows the user to switch back after using `SetZeroGuess`. 
4.3.11

```c
int HYPRE_StructPFMGSetRelaxType (HYPRE_StructSolver solver, int relax_type)
```

(Optional) Set relaxation type.

Current relaxation methods set by `relax_type` are:

- 0 & Jacobi
- 1 & Weighted Jacobi (default)
- 2 & Red/Black Gauss-Seidel (symmetric: RB pre-relaxation, BR post-relaxation)
- 3 & Red/Black Gauss-Seidel (nonsymmetric: RB pre- and post-relaxation)

4.3.12

```c
int HYPRE_StructPFMGSetRAPType (HYPRE_StructSolver solver, int rap_type)
```

(Optional) Set type of coarse-grid operator to use.

Current operators set by `rap_type` are:

- 0 – Galerkin (default)
- 1 – non-Galerkin 5-pt or 7-pt stencils

Both operators are constructed algebraically. The non-Galerkin option maintains a 5-pt stencil in 2D and a 7-pt stencil in 3D on all grid levels. The stencil coefficients are computed by averaging techniques.

4.3.13

```c
int HYPRE_StructPFMGSetNumPreRelax (HYPRE_StructSolver solver, int num_pre_relax)
```

(Optional) Set number of relaxation sweeps before coarse-grid correction
4.3.14

```
int HYPRE_StructPFMGSetNumPostRelax (HYPRE_StructSolver solver, int num_post_relax)
```

(Optional) Set number of relaxation sweeps after coarse-grid correction

4.3.15

```
int HYPRE_StructPFMGSetSkipRelax (HYPRE_StructSolver solver, int skip_relax)
```

(Optional) Skip relaxation on certain grids for isotropic problems. This can greatly improve efficiency by eliminating unnecessary relaxations when the underlying problem is isotropic.

4.3.16

```
int HYPRE_StructPFMGSetLogging (HYPRE_StructSolver solver, int logging)
```

(Optional) Set the amount of logging to do

4.3.17

```
int HYPRE_StructPFMGSetPrintLevel (HYPRE_StructSolver solver, int print_level)
```

(Optional) Set the amount of printing to do to the screen
4.3.18

```c
int HYPRE_StructPFMGGGetNumIterations (HYPRE_StructSolver solver, int* num_iterations)
```

Return the number of iterations taken

4.3.19

```c
int HYPRE_StructPFMGGGetFinalRelativeResidualNorm (HYPRE_StructSolver solver, double* norm)
```

Return the norm of the final relative residual

4.4

**Struct SMG Solver**

**Names**

4.4.1 int

```c
int HYPRE_StructSMGCreate (MPI_Comm comm,
                           HYPRE_StructSolver* solver)
```

Create a solver object

4.4.2 int

```c
int HYPRE_StructSMGDestroy (HYPRE_StructSolver solver)
```

Destroy a solver object

4.4.3 int

```c
int HYPRE_StructSMGSetup (HYPRE_StructSolver solver,
                          HYPRE_StructMatrix A,
                          HYPRE_StructVector b, HYPRE_StructVector x)
```

Prepare to solve the system

4.4.4 int

```c
int HYPRE_StructSMGSolve (HYPRE_StructSolver solver,
                         HYPRE_StructMatrix A, HYPRE_StructVector b,
                         HYPRE_StructVector x)
```

Solve the system

4.4.5 int
SMG is a semicoarsening multigrid solver that uses plane smoothing (in 3D). The plane smoother calls a 2D SMG algorithm with line smoothing, and the line smoother is cyclic reduction (1D SMG). For periodic problems, the grid size in periodic dimensions currently must be a power-of-two.
### 4.4.1

```c
int HYPRE_StructSMGCreate (MPI_Comm comm, HYPRE_StructSolver* solver)
```

Create a solver object

### 4.4.2

```c
int HYPRE_StructSMGDestroy (HYPRE_StructSolver solver)
```

Destroy a solver object

### 4.4.3

```c
int HYPRE_StructSMGSetup (HYPRE_StructSolver solver, HYPRE_StructMatrix A, HYPRE_StructVector b, HYPRE_StructVector x)
```

Prepare to solve the system. The coefficient data in b and x is ignored here, but information about the layout of the data may be used.

### 4.4.4

```c
int HYPRE_StructSMGSolve (HYPRE_StructSolver solver, HYPRE_StructMatrix A, HYPRE_StructVector b, HYPRE_StructVector x)
```

Solve the system
4.4.5

```c
int HYPRE_StructSMGSetTol (HYPRE_StructSolver solver, double tol)
```

(Optional) Set the convergence tolerance

4.4.6

```c
int HYPRE_StructSMGSetMaxIter (HYPRE_StructSolver solver, int max_iter)
```

(Optional) Set maximum number of iterations

4.4.7

```c
int HYPRE_StructSMGSetRelChange (HYPRE_StructSolver solver, int rel_change)
```

(Optional) Additionally require that the relative difference in successive iterates be small

4.4.8

```c
int HYPRE_StructSMGSetZeroGuess (HYPRE_StructSolver solver)
```

(Optional) Use a zero initial guess. This allows the solver to cut corners in the case where a zero initial guess is needed (e.g., for preconditioning) to reduce computational cost.
4.4.9  

\begin{verbatim}
int HYPRE_StructSMGSetNonZeroGuess (HYPRE_StructSolver solver)
\end{verbatim}

(Optional) Use a nonzero initial guess. This is the default behavior, but this routine allows the user to switch back after using SetZeroGuess.

4.4.10  

\begin{verbatim}
int HYPRE_StructSMGSetNumPreRelax (HYPRE_StructSolver solver, int num_pre_relax)
\end{verbatim}

(Optional) Set number of relaxation sweeps before coarse-grid correction

4.4.11  

\begin{verbatim}
int HYPRE_StructSMGSetNumPostRelax (HYPRE_StructSolver solver, int num_post_relax)
\end{verbatim}

(Optional) Set number of relaxation sweeps after coarse-grid correction

4.4.12  

\begin{verbatim}
int HYPRE_StructSMGSetLogging (HYPRE_StructSolver solver, int logging)
\end{verbatim}

(Optional) Set the amount of logging to do
4.4.13

```c
int HYPRE_StructSMGSetPrintLevel (HYPRE_StructSolver solver, int print_level)
```

(Optional) Set the amount of printing to do to the screen

4.4.14

```c
int HYPRE_StructSMGGetNumIterations (HYPRE_StructSolver solver, int* num_iterations)
```

Return the number of iterations taken

4.4.15

```c
int HYPRE_StructSMGGetFinalRelativeResidualNorm (HYPRE_StructSolver solver, double* norm)
```

Return the norm of the final relative residual

4.5

**Struct PCG Solver**

**Names**

4.5.1

```c
int HYPRE_StructPCGCreate (MPI_Comm comm,
                           HYPRE_StructSolver* solver)
```

*Create a solver object*  .................................................................

4.5.2

```c
int HYPRE_StructPCGDestroy (HYPRE_StructSolver solver)
```

*Destroy a solver object*  .................................................................

4.5.3

```c
int
```

4 Struct Solvers

**HYPRE_StructDiagScaleSetup** (HYPRE_StructSolver solver,  
HYPRE_StructMatrix A,  
HYPRE_StructVector y,  
HYPRE_StructVector x)

Setup routine for diagonal preconditioning  

4.5.4 int  
**HYPRE_StructDiagScale** (HYPRE_StructSolver solver,  
HYPRE_StructMatrix HA,  
HYPRE_StructVector Hy,  
HYPRE_StructVector Hx)

Solve routine for diagonal preconditioning  

These routines should be used in conjunction with the generic interface in PCG Solver.

4.5.1 int  
**HYPRE_StructPCGCreate** (MPI_Comm comm, HYPRE_StructSolver* solver)

Create a solver object

4.5.2 int  
**HYPRE_StructPCGDestroy** (HYPRE_StructSolver solver)

Destroy a solver object

4.5.3 int  
**HYPRE_StructDiagScaleSetup** (HYPRE_StructSolver solver,  
HYPRE_StructMatrix A, HYPRE_StructVector y, HYPRE_StructVector x)

Setup routine for diagonal preconditioning
### 4.5.4

```c
int HYPRE_StructDiagScale (HYPRE_StructSolver solver, HYPRE_StructMatrix HA, HYPRE_StructVector Hy, HYPRE_StructVector Hx)
```

Solve routine for diagonal preconditioning

### 4.6

#### Struct GMRES Solver

**Names**

**4.6.1**

```c
int HYPRE_StructGMRESCreate (MPI_Comm comm, HYPRE_StructSolver* solver)
```

Create a solver object

**4.6.2**

```c
int HYPRE_StructGMRESDestroy (HYPRE_StructSolver solver)
```

Destroy a solver object

These routines should be used in conjunction with the generic interface in GMRES Solver.

**4.6.1**

```c
int HYPRE_StructGMRESCreate (MPI_Comm comm, HYPRE_StructSolver* solver)
```

Create a solver object

**4.6.2**

```c
int HYPRE_StructGMRESDestroy (HYPRE_StructSolver solver)
```

Destroy a solver object
4.7

Struct FlexGMRES Solver

Names

4.7.1 int HYPRE_StructFlexGMRESCreate (MPI_Comm comm, HYPRE_StructSolver* solver)

Create a solver object

4.7.2 int HYPRE_StructFlexGMRESDestroy (HYPRE_StructSolver solver)

Destroy a solver object

These routines should be used in conjunction with the generic interface in FlexGMRES Solver.

4.7.1

int HYPRE_StructFlexGMRESCreate (MPI_Comm comm, HYPRE_StructSolver* solver)

Create a solver object

4.7.2

int HYPRE_StructFlexGMRESDestroy (HYPRE_StructSolver solver)

Destroy a solver object

4.8

Struct LGMRES Solver

Names

4.8.1 int
**Struct Solvers**

4.8.1  int  

**HYPRE_StructLGMRESCreate** (MPI_Comm comm, HYPRE_StructSolver* solver)

Create a solver object

4.8.2  int  

**HYPRE_StructLGMRESDestroy** (HYPRE_StructSolver solver)

Destroy a solver object

These routines should be used in conjunction with the generic interface in LGMRES Solver.

4.9  Struct BiCGSTAB Solver

Names

4.9.1  int  

**HYPRE_StructBiCGSTABCreate** (MPI_Comm comm, HYPRE_StructSolver* solver)

Create a solver object

4.9.2  int  

**HYPRE_StructBiCGSTABDestroy** (HYPRE_StructSolver solver)

Destroy a solver object

These routines should be used in conjunction with the generic interface in BiCGSTAB Solver.
4.9.1

int HYPRE_StructBiCGSTABCreate (MPI_Comm comm, HYPRE_StructSolver* solver)

Create a solver object

4.9.2

int HYPRE_StructBiCGSTABDestroy (HYPRE_StructSolver solver)

Destroy a solver object

4.10

Struct Hybrid Solver

Names

4.10.1 int HYPRE_StructHybridCreate (MPI_Comm comm, HYPRE_StructSolver* solver)

Create a solver object ................................................................. S7

4.10.2 int HYPRE_StructHybridDestroy (HYPRE_StructSolver solver)

Destroy a solver object ................................................................. S7

4.10.3 int HYPRE_StructHybridSetup (HYPRE_StructSolver solver,
HUYPRE_StructMatrix A,
HUYPRE_StructVector b,
HUYPRE_StructVector x)

Prepare to solve the system. ........................................................... S7

4.10.4 int HYPRE_StructHybridSolve (HYPRE_StructSolver solver,
HUYPRE_StructMatrix A,
HUYPRE_StructVector b,
HUYPRE_StructVector x)

Solve the system ................................................................. S8

4.10.5 int
4.10.6 int HYPRE_StructHybridSetConvergenceTol (HYPRE_StructSolver solver, double cf_tol)
   (Optional) Set an accepted convergence tolerance for diagonal scaling (DS).

4.10.7 int HYPRE_StructHybridSetDSCGMaxIter (HYPRE_StructSolver solver, int ds_max_its)
   (Optional) Set maximum number of iterations for diagonal scaling (DS).

4.10.8 int HYPRE_StructHybridSetPCGMaxIter (HYPRE_StructSolver solver, int pre_max_its)
   (Optional) Set maximum number of iterations for general preconditioner (PRE).

4.10.9 int HYPRE_StructHybridSetTwoNorm (HYPRE_StructSolver solver, int two_norm)
   (Optional) Use the two-norm in stopping criteria

4.10.10 int HYPRE_StructHybridSetRelChange (HYPRE_StructSolver solver, int rel_change)
   (Optional) Additionally require that the relative difference in successive iterates be small

4.10.11 int HYPRE_StructHybridSetSolverType (HYPRE_StructSolver solver, int solver_type)
   (Optional) Set the type of Krylov solver to use.

4.10.12 int HYPRE_StructHybridSetKDim (HYPRE_StructSolver solver, int k_dim)
   (Optional) Set the maximum size of the Krylov space when using GMRES

4.10.13 int HYPRE_StructHybridSetPrecond (HYPRE_StructSolver solver, 
                                      HYPRE_PtrToStructSolverFcn precond, 
                                      HYPRE_PtrToStructSolverFcn precond_setup, 
                                      HYPRE_StructSolver precond_solver)
   (Optional) Set the preconditioner to use

4.10.14 int HYPRE_StructHybridSetLogging (HYPRE_StructSolver solver, int logging)
   (Optional) Set the amount of logging to do

4.10.15 int HYPRE_StructHybridSetPrintLevel (HYPRE_StructSolver solver, 
                                          int print_level)
   (Optional) Set the amount of printing to do to the screen

4.10.16 int
HYPRE_StructHybridGetNumIterations (HYPRE_StructSolver solver, int* num_its)

Return the number of iterations taken ........................................... 91

4.10.17 int
HYPRE_StructHybridGetDSCGNumIterations (HYPRE_StructSolver solver, int* ds_num_its)

Return the number of diagonal scaling iterations taken .................... 91

4.10.18 int
HYPRE_StructHybridGetPCGNumIterations (HYPRE_StructSolver solver, int* pre_num_its)

Return the number of general preconditioning iterations taken .......... 91

4.10.19 int
HYPRE_StructHybridGetFinalRelativeResidualNorm

(HYPRE_StructSolver solver, double* norm)

Return the norm of the final relative residual .................................. 91

4.10.1

int
HYPRE_StructHybridCreate (MPI_Comm comm, HYPRE_StructSolver* solver)

Create a solver object

4.10.2

int
HYPRE_StructHybridDestroy (HYPRE_StructSolver solver)

Destroy a solver object

4.10.3

int
HYPRE_StructHybridSetup (HYPRE_StructSolver solver,
HYPRE_StructMatrix A, HYPRE_StructVector b, HYPRE_StructVector x)
Prepare to solve the system. The coefficient data in \( b \) and \( x \) is ignored here, but information about the layout of the data may be used.

### 4.10.4

```c
int HYPRE_StructHybridSolve (HYPRE_StructSolver solver, HYPRE_StructMatrix A, HYPRE_StructVector b, HYPRE_StructVector x)
```

Solve the system

### 4.10.5

```c
int HYPRE_StructHybridSetTol (HYPRE_StructSolver solver, double tol)
```

(Optional) Set the convergence tolerance

### 4.10.6

```c
int HYPRE_StructHybridSetConvergenceTol (HYPRE_StructSolver solver, double cf_tol)
```

(Optional) Set an accepted convergence tolerance for diagonal scaling (DS). The solver will switch preconditioners if the convergence of DS is slower than \( cf\_tol \).

### 4.10.7

```c
int HYPRE_StructHybridSetDSCGMaxIter (HYPRE_StructSolver solver, int ds_max_its)
```

(Optional) Set maximum number of iterations for diagonal scaling (DS). The solver will switch preconditioners if DS reaches \( ds\_max\_its \).
4.10.8

int HYPRE_StructHybridSetPCGMaxIter (HYPRE_StructSolver solver, int pre_max_its)

(Optional) Set maximum number of iterations for general preconditioner (PRE). The solver will stop if PRE reaches pre_max_its.

4.10.9

int HYPRE_StructHybridSetTwoNorm (HYPRE_StructSolver solver, int two_norm)

(Optional) Use the two-norm in stopping criteria

4.10.10

int HYPRE_StructHybridSetRelChange (HYPRE_StructSolver solver, int rel_change)

(Optional) Additionally require that the relative difference in successive iterates be small

4.10.11

int HYPRE_StructHybridSetSolverType (HYPRE_StructSolver solver, int solver_type)

(Optional) Set the type of Krylov solver to use.

Current krylov methods set by solver_type are:
0 – PCG (default)
1 – GMRES
2 – BiCGSTAB

### 4.10.12

```c
int HYPRE_StructHybridSetKDim (HYPRE_StructSolver solver, int k_dim)
```

(Optional) Set the maximum size of the Krylov space when using GMRES

### 4.10.13

```c
int HYPRE_StructHybridSetPrecond (HYPRE_StructSolver solver,
        HYPRE_PtrToStructSolverFcn precond, HYPRE_PtrToStructSolverFcn
        precond_setup, HYPRE_StructSolver precond_solver)
```

(Optional) Set the preconditioner to use

### 4.10.14

```c
int HYPRE_StructHybridSetLogging (HYPRE_StructSolver solver, int logging)
```

(Optional) Set the amount of logging to do

### 4.10.15

```c
int HYPRE_StructHybridSetPrintLevel (HYPRE_StructSolver solver, int
        print_level)
```

(Optional) Set the amount of printing to do to the screen
4.10.16

```c
int HYPRE_StructHybridGetNumIterations (HYPRE_StructSolver solver, int* num_its)
```

Return the number of iterations taken

4.10.17

```c
int HYPRE_StructHybridGetDSCGNumIterations (HYPRE_StructSolver solver, int* ds_num_its)
```

Return the number of diagonal scaling iterations taken

4.10.18

```c
int HYPRE_StructHybridGetPCGNumIterations (HYPRE_StructSolver solver, int* pre_num_its)
```

Return the number of general preconditioning iterations taken

4.10.19

```c
int HYPRE_StructHybridGetFinalRelativeResidualNorm (HYPRE_StructSolver solver, double* norm)
```

Return the norm of the final relative residual
4.11 Struct LOBPCG Eigensolver

Names

4.11.1 int HYPRE_StructSetupInterpreter (mv_InterfaceInterpreter* i)
Load interface interpreter. ..................................................... 92

4.11.2 int HYPRE_StructSetupMatvec (HYPRE_MatvecFunctions* mv)
Load Matvec interpreter with hypre_StructKrylov functions ............ 92

These routines should be used in conjunction with the generic interface in LOBPCG Eigensolver.

4.11.1 int HYPRE_StructSetupInterpreter (mv_InterfaceInterpreter* i)

Load interface interpreter. Vector part loaded with hypre_StructKrylov functions and multivector part loaded with mv_TempMultiVector functions.

4.11.2 int HYPRE_StructSetupMatvec (HYPRE_MatvecFunctions* mv)

Load Matvec interpreter with hypre_StructKrylov functions
These solvers use matrix/vector storage schemes that are tailored to semi-structured grid problems.
typedef struct hypre_SStructSolver_struct *HYPRE_SStructSolver

The solver object

SSStruct SysPFMG Solver

Names

5.2.1 int HYPRE_SStructSysPFMGCreate (MPI_Comm comm, HYPRE_SStructSolver* solver)

Create a solver object  .............................................................. 96

5.2.2 int HYPRE_SStructSysPFMGSolve (HYPRE_SStructSolver solver)

Destroy a solver object. .............................................................. 96

5.2.3 int HYPRE_SStructSysPFMGSetup (HYPRE_SStructSolver solver,
    HYPRE_SStructMatrix A,
    HYPRE_SStructVector b,
    HYPRE_SStructVector x)

Prepare to solve the system. ..................................................... 96

5.2.4 int HYPRE_SStructSysPFMGSolve (HYPRE_SStructSolver solver,
    HYPRE_SStructMatrix A,
    HYPRE_SStructVector b,
    HYPRE_SStructVector x)

Solve the system ................................................................. 96

5.2.5 int HYPRE_SStructSysPFMGSetTol (HYPRE_SStructSolver solver, double tol)

(Optional) Set the convergence tolerance .................................... 97

5.2.6 int HYPRE_SStructSysPFMGSetMaxIter (HYPRE_SStructSolver solver,
    int max_iter)

(Optional) Set maximum number of iterations .............................. 97

5.2.7 int HYPRE_SStructSysPFMGSetRelChange (HYPRE_SStructSolver solver,
    int rel_change)

(Optional) Additionally require that the relative difference in successive
iterates be small ................................................................. 97

5.2.8 int
SysPFMG is a semicoarsening multigrid solver similar to PFMG, but for systems of PDEs. For periodic problems, users should try to set the grid size in periodic dimensions to be as close to a power-of-two as possible (for more details, see Struct PFMG Solver).
5.2.1

int HYPRE_SStructSysPFMGCreate (MPI_Comm comm, HYPRE_SStructSolver* solver)

Create a solver object

5.2.2

int HYPRE_SStructSysPFMGDestroy (HYPRE_SStructSolver solver)

Destroy a solver object. An object should be explicitly destroyed using this destructor when the user’s code no longer needs direct access to it. Once destroyed, the object must not be referenced again. Note that the object may not be deallocated at the completion of this call, since there may be internal package references to the object. The object will then be destroyed when all internal reference counts go to zero.

5.2.3

int HYPRE_SStructSysPFMGSsetup (HYPRE_SStructSolver solver, HYPRE_SStructMatrix A, HYPRE_SStructVector b, HYPRE_SStructVector x)

Prepare to solve the system. The coefficient data in b and x is ignored here, but information about the layout of the data may be used.

5.2.4

int HYPRE_SStructSysPFMGsolve (HYPRE_SStructSolver solver, HYPRE_SStructMatrix A, HYPRE_SStructVector b, HYPRE_SStructVector x)

Solve the system
### 5.2.5

```c
int HYPRE_SStructSysPFMGSetTol (HYPRE_SStructSolver solver, double tol)
```

(Optional) Set the convergence tolerance

### 5.2.6

```c
int HYPRE_SStructSysPFMGSetMaxIter (HYPRE_SStructSolver solver, int max_iter)
```

(Optional) Set maximum number of iterations

### 5.2.7

```c
int HYPRE_SStructSysPFMGSetRelChange (HYPRE_SStructSolver solver, int rel_change)
```

(Optional) Additionally require that the relative difference in successive iterates be small

### 5.2.8

```c
int HYPRE_SStructSysPFMGSetZeroGuess (HYPRE_SStructSolver solver)
```

(Optional) Use a zero initial guess. This allows the solver to cut corners in the case where a zero initial guess is needed (e.g., for preconditioning) to reduce computational cost.
### 5.2.9

```c
int HYPRE_SStructSysPFMGSetNonZeroGuess (HYPRE_SStructSolver solver)
```

(Optional) Use a nonzero initial guess. This is the default behavior, but this routine allows the user to switch back after using `SetZeroGuess`.

### 5.2.10

```c
int HYPRE_SStructSysPFMGSetRelaxType (HYPRE_SStructSolver solver, int relax_type)
```

(Optional) Set relaxation type.

Current relaxation methods set by `relax_type` are:

- 0 – Jacobi
- 1 – Weighted Jacobi (default)
- 2 – Red/Black Gauss-Seidel (symmetric: RB pre-relaxation, BR post-relaxation)

### 5.2.11

```c
int HYPRE_SStructSysPFMGSetJacobiWeight (HYPRE_SStructSolver solver, double weight)
```

(Optional) Set Jacobi Weight

### 5.2.12

```c
int HYPRE_SStructSysPFMGSetNumPreRelax (HYPRE_SStructSolver solver, int num_pre_relax)
```

(Optional) Set number of relaxation sweeps before coarse-grid correction
5.2.13

```
int HYPRE_SStructSysPFMGSetNumPostRelax (HYPRE_SStructSolver solver, int num_post_relax)
```

(Optional) Set number of relaxation sweeps after coarse-grid correction

5.2.14

```
int HYPRE_SStructSysPFMGSetSkipRelax (HYPRE_SStructSolver solver, int skip_relax)
```

(Optional) Skip relaxation on certain grids for isotropic problems. This can greatly improve efficiency by eliminating unnecessary relaxations when the underlying problem is isotropic.

5.2.15

```
int HYPRE_SStructSysPFMGSetLogging (HYPRE_SStructSolver solver, int logging)
```

(Optional) Set the amount of logging to do

5.2.16

```
int HYPRE_SStructSysPFMGSetPrintLevel (HYPRE_SStructSolver solver, int print_level)
```

(Optional) Set the amount of printing to do to the screen
5.2.17

int HYPRE_SStructSysPFMGGetNumIterations (HYPRE_SStructSolver solver, int* num_iterations)

Return the number of iterations taken

5.2.18

int HYPRE_SStructSysPFMGGetFinalRelativeResidualNorm (HYPRE_SStructSolver solver, double* norm)

Return the norm of the final relative residual

5.3

SStruct Split Solver

Names

5.3.1 int HYPRE_SStructSplitCreate (MPI_Comm comm, HYPRE_SStructSolver* solver)

Create a solver object ................................................................. 101

5.3.2 int HYPRE_SStructSplitDestroy (HYPRE_SStructSolver solver)

Destroy a solver object. ............................................................... 101

5.3.3 int HYPRE_SStructSplitSetup (HYPRE_SStructSolver solver, HYPRE_SStructMatrix A, HYPRE_SStructVector b, HYPRE_SStructVector x)

Prepare to solve the system. ...................................................... 102

5.3.4 int HYPRE_SStructSplitSolve (HYPRE_SStructSolver solver, HYPRE_SStructMatrix A, HYPRE_SStructVector b, HYPRE_SStructVector x)

Solve the system ................................................................. 102

5.3.5 int
### 5.3.1

**int**

**HYPRE_SStructSplitCreate** *(MPI_Comm comm, HYPRE_SStructSolver* solver)*

Create a solver object

### 5.3.2

**int**

**HYPRE_SStructSplitDestroy** *(HYPRE_SStructSolver solver)*
Destroy a solver object. An object should be explicitly destroyed using this destructor when the user’s code no longer needs direct access to it. Once destroyed, the object must not be referenced again. Note that the object may not be deallocated at the completion of this call, since there may be internal package references to the object. The object will then be destroyed when all internal reference counts go to zero.

5.3.3

```c
int HYPRE_SStructSplitSetup (HYPRE_SStructSolver solver,
                           HYPRE_SStructMatrix A, HYPRE_SStructVector b, HYPRE_SStructVector x)
```

Prepare to solve the system. The coefficient data in b and x is ignored here, but information about the layout of the data may be used.

5.3.4

```c
int HYPRE_SStructSplitSolve (HYPRE_SStructSolver solver,
                           HYPRE_SStructMatrix A, HYPRE_SStructVector b, HYPRE_SStructVector x)
```

Solve the system.

5.3.5

```c
int HYPRE_SStructSplitSetTol (HYPRE_SStructSolver solver, double tol)
```

(Optional) Set the convergence tolerance.

5.3.6

```c
int HYPRE_SStructSplitSetMaxIter (HYPRE_SStructSolver solver, int max_iter)
```

(Optional) Set maximum number of iterations.
5.3.7

int HYPRE_SStructSplitSetZeroGuess (HYPRE_SStructSolver solver)

(Optional) Use a zero initial guess. This allows the solver to cut corners in the case where a zero initial guess is needed (e.g., for preconditioning) to reduce computational cost.

5.3.8

int HYPRE_SStructSplitSetNonZeroGuess (HYPRE_SStructSolver solver)

(Optional) Use a nonzero initial guess. This is the default behavior, but this routine allows the user to switch back after using SetZeroGuess.

5.3.9

int HYPRE_SStructSplitSetStructSolver (HYPRE_SStructSolver solver, int ssolver)

(Optional) Set up the type of diagonal struct solver. Either ssolver is set to HYPRE_SMG or HYPRE_PFMG.

5.3.10

int HYPRE_SStructSplitGetNumIterations (HYPRE_SStructSolver solver, int* num_iterations)

Return the number of iterations taken
5.3.11

```c
int HYPRE_SStructSplitGetFinalRelativeResidualNorm(HYPRE_SStructSolver solver, double* norm)
```

Return the norm of the final relative residual

5.4

SStruct FAC Solver

Names

5.4.1 int HYPRE_SStructFACCreate (MPI_Comm comm,
HYPRE_SStructSolver* solver)

Create a solver object

5.4.2 int HYPRE_SStructFACDestroy2 (HYPRE_SStructSolver solver)

Destroy a solver object.

5.4.3 int HYPRE_SStructFACAMR_RAP (HYPRE_SStructMatrix A,
int (*rfactors)[3],
HYPRE_SStructMatrix* fac_A)

Re-distribute the composite matrix so that the amr hierarchy is approximately
nested.

5.4.4 int HYPRE_SStructFACSetup2 (HYPRE_SStructSolver solver,
HYPRE_SStructMatrix A,
HYPRE_SStructVector b,
HYPRE_SStructVector x)

Set up the FAC solver structure

5.4.5 int HYPRE_SStructFACSolve3 (HYPRE_SStructSolver solver,
HYPRE_SStructMatrix A,
HYPRE_SStructVector b,
HYPRE_SStructVector x)

Solve the system

5.4.6 int HYPRE_SStructFACSetPLevels (HYPRE_SStructSolver solver, int nparts,
int* plevels)

Set up amr structure

5.4.7 int
5.4.8 \textbf{HYPRE\_SStructFACSetPRefinements} (HYPRE\_SStructSolver solver, int nparts, int (*rfactors)[3])

Set up amr refinement factors ........................................... 108

5.4.9 \textbf{HYPRE\_SStructFACZeroCFSten} (HYPRE\_SStructMatrix A, HYPRE\_SStructGrid grid, int part, int rfactors[3])

(Optional, but user must make sure that they do this function otherwise)
Zero off the coarse level stencils reaching into a fine level grid ........... 108

5.4.10 \textbf{HYPRE\_SStructFACZeroFCSten} (HYPRE\_SStructMatrix A, HYPRE\_SStructGrid grid, int part)

(Optional, but user must make sure that they do this function otherwise)
Zero off the fine level stencils reaching into a coarse level grid ........... 108

5.4.11 \textbf{HYPRE\_SStructFACZeroAMRMatrixData} (HYPRE\_SStructMatrix A, int part, int crse, int rfactors[3])

(Optional, but user must make sure that they do this function otherwise)
Places the identity in the coarse grid matrix underlying the fine patches. . 109

5.4.12 \textbf{HYPRE\_SStructFACZeroAMRVectorData} (HYPRE\_SStructVector b, int* plevels, int (*rfactors)[3])

(Optional, but user must make sure that they do this function otherwise)
Places zeros in the coarse grid vector underlying the fine patches. ........... 109

5.4.13 \textbf{HYPRE\_SStructFACSetMaxLevels} (HYPRE\_SStructSolver solver, int max_levels)

(Optional) Set maximum number of FAC levels ............................ 109

5.4.14 \textbf{HYPRE\_SStructFACSetTol} (HYPRE\_SStructSolver solver, double tol)

(Optional) Set the convergence tolerance ............................... 109

5.4.15 \textbf{HYPRE\_SStructFACSetMaxIter} (HYPRE\_SStructSolver solver, int max_iter)

(Optional) Set maximum number of iterations ........................... 110

5.4.16 \textbf{HYPRE\_SStructFACSetRelChange} (HYPRE\_SStructSolver solver, int rel_change)

(Optional) Additionally require that the relative difference in successive it-
erates be small ............................................................ 110

5.4.17 \textbf{HYPRE\_SStructFACSetZeroGuess} (HYPRE\_SStructSolver solver)

(Optional) Use a zero initial guess. ..................................... 110

5.4.18 \textbf{HYPRE\_SStructFACSetNonZeroGuess} (HYPRE\_SStructSolver solver)

(Optional) Use a nonzero initial guess. ................................ 110
**HYPRE_SStructFACSetRelaxType** (HYPRE_SStructSolver solver, int relax_type)

(Optional) Set relaxation type. ..............................................

5.4.19 int **HYPRE_SStructFACSetJacobiWeight** (HYPRE_SStructSolver solver, double weight)

(Optional) Set Jacobi weight if weighted Jacobi is used ....................

5.4.20 int **HYPRE_SStructFACSetNumPreRelax** (HYPRE_SStructSolver solver, int num_pre_relax)

(Optional) Set number of relaxation sweeps before coarse-grid correction .

5.4.21 int **HYPRE_SStructFACSetNumPostRelax** (HYPERE_SStructSolver solver, int num_post_relax)

(Optional) Set number of relaxation sweeps after coarse-grid correction ..

5.4.22 int **HYPRE_SStructFACSetCoarseSolverType** (HYPRE_SStructSolver solver, int csolver_type)

(Optional) Set coarsest solver type. .........................................

5.4.23 int **HYPRE_SStructFACSetLogging** (HYPRE_SStructSolver solver, int logging)

(Optional) Set the amount of logging to do ....................................

5.4.24 int **HYPRE_SStructFACGetNumIterations** (HYPRE_SStructSolver solver, int* num_iterations)

Return the number of iterations taken .........................................

5.4.25 int **HYPRE_SStructFACGetFinalRelativeResidualNorm**

(HYPRE_SStructSolver solver, double* norm)

Return the norm of the final relative residual ..............................

5.4.1

int **HYPRE_SStructFACCreate** (MPI_Comm comm, HYPRE_SStructSolver* solver)

Create a solver object
5.4.2

```c
int HYPRE_SStructFACDestroy2(HYPRE_SStructSolver solver)
```

Destroy a solver object. An object should be explicitly destroyed using this destructor when the user’s code no longer needs direct access to it. Once destroyed, the object must not be referenced again. Note that the object may not be deallocated at the completion of this call, since there may be internal package references to the object. The object will then be destroyed when all internal reference counts go to zero.

5.4.3

```c
int HYPRE_SStructFACAMR_RAP(HYPRE_SStructMatrix A, int (*rfactors)[3], HYPRE_SStructMatrix* fac_A)
```

Re-distribute the composite matrix so that the amr hierarchy is approximately nested. Coarse underlying operators are also formed.

5.4.4

```c
int HYPRE_SStructFACSetup2(HYPRE_SStructSolver solver, HYPRE_SStructMatrix A, HYPRE_SStructVector b, HYPRE_SStructVector x)
```

Set up the FAC solver structure

5.4.5

```c
int HYPRE_SStructFACSolve3(HYPRE_SStructSolver solver, HYPRE_SStructMatrix A, HYPRE_SStructVector b, HYPRE_SStructVector x)
```

Solve the system
5.4.6

```
int HYPRE_SStructFACSetPLevels (HYPRE_SStructSolver solver, int nparts, int* plevels)
```

Set up amr structure

5.4.7

```
int HYPRE_SStructFACSetPRefinements (HYPRE_SStructSolver solver, int nparts, int (*rfactors)[3])
```

Set up amr refinement factors

5.4.8

```
int HYPRE_SStructFACZeroCFSten (HYPRE_SStructMatrix A, HYPRE_SStructGrid grid, int part, int rfactors[3])
```

(Optional, but user must make sure that they do this function otherwise) Zero off the coarse level stencils reaching into a fine level grid

5.4.9

```
int HYPRE_SStructFACZeroFCSten (HYPRE_SStructMatrix A, HYPRE_SStructGrid grid, int part)
```

(Optional, but user must make sure that they do this function otherwise) Zero off the fine level stencils reaching into a coarse level grid
5.4.10

```c
int HYPRE_SStructFACZeroAMRMatrixData (HYPRE_SStructMatrix A, int part_crse, int rfactors[3])
```

(Optional, but user must make sure that they do this function otherwise) Places the identity in the coarse grid matrix underlying the fine patches. Required between each pair of amr levels.

5.4.11

```c
int HYPRE_SStructFACZeroAMRVectorData (HYPRE_SStructVector b, int* plevels, int (*rfactors)[3])
```

(Optional, but user must make sure that they do this function otherwise) Places zeros in the coarse grid vector underlying the fine patches. Required between each pair of amr levels.

5.4.12

```c
int HYPRE_SStructFACSetMaxLevels (HYPRE_SStructSolver solver, int max_levels)
```

(Optional) Set maximum number of FAC levels

5.4.13

```c
int HYPRE_SStructFACSetTol (HYPRE_SStructSolver solver, double tol)
```

(Optional) Set the convergence tolerance
5.4.14

\texttt{int HYPRE\_SStructFACSetMaxIter (HYPRE\_SStructSolver solver, int max\_iter)}

(Optional) Set maximum number of iterations

5.4.15

\texttt{int HYPRE\_SStructFACSetRelChange (HYPRE\_SStructSolver solver, int rel\_change)}

(Optional) Additionally require that the relative difference in successive iterates be small

5.4.16

\texttt{int HYPRE\_SStructFACSetZeroGuess (HYPRE\_SStructSolver solver)}

(Optional) Use a zero initial guess. This allows the solver to cut corners in the case where a zero initial guess is needed (e.g., for preconditioning) to reduce computational cost.

5.4.17

\texttt{int HYPRE\_SStructFACSetNonZeroGuess (HYPRE\_SStructSolver solver)}

(Optional) Use a nonzero initial guess. This is the default behavior, but this routine allows the user to switch back after using \texttt{SetZeroGuess}. 
5.4.18

```c
int HYPRE_SStructFACSetRelaxType (HYPRE_SStructSolver solver, int relax_type)
```

(Optional) Set relaxation type. See HYPRE_SStructSysPFMGSetRelaxType for appropriate values of relax_type.

5.4.19

```c
int HYPRE_SStructFACSetJacobiWeight (HYPRE_SStructSolver solver, double weight)
```

(Optional) Set Jacobi weight if weighted Jacobi is used.

5.4.20

```c
int HYPRE_SStructFACSetNumPreRelax (HYPRE_SStructSolver solver, int num_pre_relax)
```

(Optional) Set number of relaxation sweeps before coarse-grid correction.

5.4.21

```c
int HYPRE_SStructFACSetNumPostRelax (HYPRE_SStructSolver solver, int num_post_relax)
```

(Optional) Set number of relaxation sweeps after coarse-grid correction.
5.4.22

```c
int HYPRE_SStructFACSetCoarseSolverType (HYPRE_SStructSolver solver, int csolver_type)
```

(Optional) Set coarsest solver type.

Current solver types set by `csolver_type` are:

1 – SysPFMG-PCG (default)
2 – SysPFMG

5.4.23

```c
int HYPRE_SStructFACSetLogging (HYPRE_SStructSolver solver, int logging)
```

(Optional) Set the amount of logging to do

5.4.24

```c
int HYPRE_SStructFACGetNumIterations (HYPRE_SStructSolver solver, int* num_iterations)
```

Return the number of iterations taken

5.4.25

```c
int HYPRE_SStructFACGetFinalRelativeResidualNorm
(HYPRE_SStructSolver solver, double* norm)
```

Return the norm of the final relative residual
5.5 SStruct Maxwell Solver

Names

5.5.1 int

HYPRE_SStructMaxwellCreate ( MPI_Comm comm,
                             HYPRE_SStructSolver* solver )

Create a solver object ................................................................. [115]

5.5.2 int

HYPRE_SStructMaxwellDestroy ( HYPRE_SStructSolver solver )

Destroy a solver object. ................................................................. [115]

5.5.3 int

HYPRE_SStructMaxwellSetup (HYPRE_SStructSolver solver,
                             HYPRE_SStructMatrix A,
                             HYPRE_SStructVector b,
                             HYPRE_SStructVector x)

Prepare to solve the system. ............................................................ [115]

5.5.4 int

HYPRE_SStructMaxwellSolve (HYPRE_SStructSolver solver,
                            HYPRE_SStructMatrix A,
                            HYPRE_SStructVector b,
                            HYPRE_SStructVector x)

Solve the system. ................................................................. [116]

5.5.5 int

HYPRE_SStructMaxwellSolve2 (HYPRE_SStructSolver solver,
                            HYPRE_SStructMatrix A,
                            HYPRE_SStructVector b,
                            HYPRE_SStructVector x)

Solve the system. ................................................................. [116]

5.5.6 int

HYPRE_SStructMaxwellSetGrad (HYPRE_SStructSolver solver,
                             HYPRE_ParCSRMatrix T)

Sets the gradient operator in the Maxwell solver ............................... [116]

5.5.7 int

HYPRE_SStructMaxwellSetRfactors (HYPRE_SStructSolver solver,
                                 int rfactors[3])

Sets the coarsening factor ............................................................. [116]

5.5.8 int

HYPRE_SStructMaxwellPhysBdy (HYPRE_SStructGrid* grid,
                             int num_levels, int rfactors[3],
                             int*** BdryRanks_ptr,
                             int** BdryRanksCnt_ptr )

Find the physical boundary row ranks on all levels ............................. [117]

5.5.9 int
5 SStruct Solvers

**HYPRE_SStructMaxwellEliminateRowsCols** (HYPRE_ParCSRMatrix parA, int nrows, int* rows)

Eliminates the rows and cols corresponding to the physical boundary in a parcsr matrix.

5.5.10 int **HYPRE_SStructMaxwellZeroVector** (HYPRE_ParVector b, int* rows, int nrows)

Zeros the rows corresponding to the physical boundary in a par vector.

5.5.11 int **HYPRE_SStructMaxwellSetSetConstantCoef** (HYPRE_SStructSolver solver, int flag)

(Optional) Set the constant coefficient flag - Nedelec interpolation used.

5.5.12 int **HYPRE_SStructMaxwellGrad** (HYPRE_SStructGrid grid, HYPRE_ParCSRMatrix* T)

(Optional) Creates a gradient matrix from the grid.

5.5.13 int **HYPRE_SStructMaxwellSetTol** (HYPRE_SStructSolver solver, double tol)

(Optional) Set the convergence tolerance.

5.5.14 int **HYPRE_SStructMaxwellSetMaxIter** (HYPRE_SStructSolver solver, int max_iter)

(Optional) Set maximum number of iterations.

5.5.15 int **HYPRE_SStructMaxwellSetRelChange** (HYPRE_SStructSolver solver, int rel_change)

(Optional) Additionally require that the relative difference in successive iterates be small.

5.5.16 int **HYPRE_SStructMaxwellSetNumPreRelax** (HYPRE_SStructSolver solver, int num_pre_relax)

(Optional) Set number of relaxation sweeps before coarse-grid correction.

5.5.17 int **HYPRE_SStructMaxwellSetNumPostRelax** (HYPRE_SStructSolver solver, int num_post_relax)

(Optional) Set number of relaxation sweeps after coarse-grid correction.

5.5.18 int **HYPRE_SStructMaxwellSetLogging** (HYPRE_SStructSolver solver, int logging)

(Optional) Set the amount of logging to do.

5.5.19 int **HYPRE_SStructMaxwellGetNumIterations** (HYPRE_SStructSolver solver, int* num_iterations)

Return the number of iterations taken.

5.5.20 int
**HYPRE_SStructMaxwellGetFinalRelativeResidualNorm**

(HYPRE_SStructSolver solver, double* norm)

*Return the norm of the final relative residual* ……………………

---

**5.5.1**

```c
int HYPRE_SStructMaxwellCreate ( MPI_Comm comm, HYPRE_SStructSolver* solver )
```

Create a solver object

---

**5.5.2**

```c
int HYPRE_SStructMaxwellDestroy ( HYPRE_SStructSolver solver )
```

Destroy a solver object. An object should be explicitly destroyed using this destructor when the user’s code no longer needs direct access to it. Once destroyed, the object must not be referenced again. Note that the object may not be deallocated at the completion of this call, since there may be internal package references to the object. The object will then be destroyed when all internal reference counts go to zero.

---

**5.5.3**

```c
int HYPRE_SStructMaxwellSetup ( HYPRE_SStructSolver solver, HYPRE_SStructMatrix A, HYPRE_SStructVector b, HYPRE_SStructVector x)
```

Prepare to solve the system. The coefficient data in b and x is ignored here, but information about the layout of the data may be used.
5.5.4

```c
int HYPRE_SStructMaxwellSolve (HYPRE_SStructSolver solver, HYPRE_SStructMatrix A, HYPRE_SStructVector b, HYPRE_SStructVector x)
```

Solve the system. Full coupling of the augmented system used throughout the multigrid hierarchy.

5.5.5

```c
int HYPRE_SStructMaxwellSolve2 (HYPRE_SStructSolver solver, HYPRE_SStructMatrix A, HYPRE_SStructVector b, HYPRE_SStructVector x)
```

Solve the system. Full coupling of the augmented system used only on the finest level, i.e., the node and edge multigrid cycles are coupled only on the finest level.

5.5.6

```c
int HYPRE_SStructMaxwellSetGrad (HYPRE_SStructSolver solver, HYPRE_ParCSRMatrix T)
```

Sets the gradient operator in the Maxwell solver

5.5.7

```c
int HYPRE_SStructMaxwellSetRfactors (HYPRE_SStructSolver solver, int rfactors[3])
```

Sets the coarsening factor
5.5.8

```c
int HYPRE_SStructMaxwellPhysBdy (HYPRE_SStructGrid* grid, int num_levels, int rfactors[3], int*** BdryRanks_ptr, int** BdryRanksCnt_ptr )
```

Finds the physical boundary row ranks on all levels

5.5.9

```c
int HYPRE_SStructMaxwellEliminateRowsCols (HYPRE_ParCSRMatrix parA, int nrows, int* rows )
```

Eliminates the rows and cols corresponding to the physical boundary in a parcsr matrix

5.5.10

```c
int HYPRE_SStructMaxwellZeroVector (HYPRE_ParVector b, int* rows, int nrows )
```

Zeros the rows corresponding to the physical boundary in a par vector

5.5.11

```c
int HYPRE_SStructMaxwellSetSetConstantCoef (HYPRE_SStructSolver solver, int flag)
```

(Optional) Set the constant coefficient flag- Nedelec interpolation used
5.5.12

```
int HYPRE_SStructMaxwellGrad (HYPRE_SStructGrid grid, HYPRE_ParCSRMatrix* T)
```

(Optional) Creates a gradient matrix from the grid. This presupposes a particular orientation of the edge elements.

5.5.13

```
int HYPRE_SStructMaxwellSetTol (HYPRE_SStructSolver solver, double tol)
```

(Optional) Set the convergence tolerance

5.5.14

```
int HYPRE_SStructMaxwellSetMaxIter (HYPRE_SStructSolver solver, int max_iter)
```

(Optional) Set maximum number of iterations

5.5.15

```
int HYPRE_SStructMaxwellSetRelChange (HYPRE_SStructSolver solver, int rel_change)
```

(Optional) Additionally require that the relative difference in successive iterates be small
5.5.16

```c
int HYPRE_SStructMaxwellSetNumPreRelax (HYPRE_SStructSolver solver, int num_pre_relax)
```

(Optional) Set number of relaxation sweeps before coarse-grid correction

5.5.17

```c
int HYPRE_SStructMaxwellSetNumPostRelax (HYPRE_SStructSolver solver, int num_post_relax)
```

(Optional) Set number of relaxation sweeps after coarse-grid correction

5.5.18

```c
int HYPRE_SStructMaxwellSetLogging (HYPRE_SStructSolver solver, int logging)
```

(Optional) Set the amount of logging to do

5.5.19

```c
int HYPRE_SStructMaxwellGetNumIterations (HYPRE_SStructSolver solver, int* num_iterations)
```

Return the number of iterations taken
### 5.5.20

```c
int HYPRE_SStructMaxwellGetFinalRelativeResidualNorm
(HYPRE_SStructSolver solver, double* norm)
```

Return the norm of the final relative residual.

### 5.6

**SStruct PCG Solver**

**Names**

#### 5.6.1

```c
int HYPRE_SStructPCGCreate (MPI_Comm comm,
   HYPRE_SStructSolver* solver)
```

Create a solver object

#### 5.6.2

```c
int HYPRE_SStructPCGDestroy (HYPRE_SStructSolver solver)
```

Destroy a solver object.

#### 5.6.3

```c
int HYPRE_SStructDiagScaleSetup (HYPRE_SStructSolver solver,
   HYPRE_SStructMatrix A,
   HYPRE_SStructVector y,
   HYPRE_SStructVector x)
```

Setup routine for diagonal preconditioning

#### 5.6.4

```c
int HYPRE_SStructDiagScale (HYPRE_SStructSolver solver,
   HYPRE_SStructMatrix A,
   HYPRE_SStructVector y,
   HYPRE_SStructVector x)
```

Solve routine for diagonal preconditioning

These routines should be used in conjunction with the generic interface in PCG Solver.
Create a solver object

### 5.6.2

```c
int HYPRE_SStructPCGDestroy (HYPRE_SStructSolver solver)
```

Destroy a solver object. An object should be explicitly destroyed using this destructor when the user’s code no longer needs direct access to it. Once destroyed, the object must not be referenced again. Note that the object may not be deallocated at the completion of this call, since there may be internal package references to the object. The object will then be destroyed when all internal reference counts go to zero.

### 5.6.3

```c
int HYPRE_SStructDiagScaleSetup (HYPRE_SStructSolver solver,
                                 HYPRE_SStructMatrix A, HYPRE_SStructVector y, HYPRE_SStructVector x)
```

Setup routine for diagonal preconditioning

### 5.6.4

```c
int HYPRE_SStructDiagScale (HYPRE_SStructSolver solver,
                           HYPRE_SStructMatrix A, HYPRE_SStructVector y, HYPRE_SStructVector x)
```

Solve routine for diagonal preconditioning

### 5.7

**SSStruct GMRES Solver**

**Names**

### 5.7.1

```c
int
```
HYPRE_SStructGMRESCreate (MPI_Comm comm, HYPRE_SStructSolver* solver)

Create a solver object

5.7.2 int

HYPRE_SStructGMRESDestroy (HYPRE_SStructSolver solver)

Destroy a solver object.

These routines should be used in conjunction with the generic interface in GMRES Solver.

5.8 SStruct FlexGMRES Solver

Names

5.8.1 int

HYPRE_SStructFlexGMRESCreate (MPI_Comm comm, HYPRE_SStructSolver* solver)

Create a solver object

5.8.2 int
### 5.8.1 SStruct FlexGMRES Destroy

```c
int HYPRE_SStructFlexGMRESDestroy (HYPRE_SStructSolver solver)
```

Destroy a solver object.

These routines should be used in conjunction with the generic interface in FlexGMRES Solver.

### 5.8.2 SStruct FlexGMRES Create

```c
int HYPRE_SStructFlexGMRESCreate (MPI_Comm comm, HYPRE_SStructSolver* solver)
```

Create a solver object.

### 5.8.2 SStruct FlexGMRES Destroy

```c
int HYPRE_SStructFlexGMRESDestroy (HYPRE_SStructSolver solver)
```

Destroy a solver object. An object should be explicitly destroyed using this destructor when the user’s code no longer needs direct access to it. Once destroyed, the object must not be referenced again. Note that the object may not be deallocated at the completion of this call, since there may be internal package references to the object. The object will then be destroyed when all internal reference counts go to zero.

### 5.9 SStruct LGMRES Solver

These routines should be used in conjunction with the generic interface in LGMRES Solver.

#### Names

<table>
<thead>
<tr>
<th>5.9.1</th>
<th>int</th>
</tr>
</thead>
<tbody>
<tr>
<td>HYPRE_SStructLGMRESCreate (MPI_Comm comm, HYPRE_SStructSolver* solver)</td>
<td></td>
</tr>
</tbody>
</table>

Create a solver object.

<table>
<thead>
<tr>
<th>5.9.2</th>
<th>int</th>
</tr>
</thead>
<tbody>
<tr>
<td>HYPRE_SStructLGMRESDestroy (HYPRE_SStructSolver solver)</td>
<td></td>
</tr>
</tbody>
</table>

Destroy a solver object.
5.9.1

int HYPRE_SStructLGMRESCreate (MPI_Comm comm, HYPRE_SStructSolver* solver)

Create a solver object

5.9.2

int HYPRE_SStructLGMRESDestroy (HYPRE_SStructSolver solver)

Destroy a solver object. An object should be explicitly destroyed using this destructor when the user's code no longer needs direct access to it. Once destroyed, the object must not be referenced again. Note that the object may not be deallocated at the completion of this call, since there may be internal package references to the object. The object will then be destroyed when all internal reference counts go to zero.

5.10

SStruct BiCGSTAB Solver

Names

5.10.1 int HYPRE_SStructBiCGSTABCreate (MPI_Comm comm, HYPRE_SStructSolver* solver)

Create a solver object

5.10.2 int HYPRE_SStructBiCGSTABDestroy (HYPRE_SStructSolver solver)

Destroy a solver object.

These routines should be used in conjunction with the generic interface in BiCGSTAB Solver.
5.10.1

int HYPRE_SStructBiCGSTABCreate (MPI_Comm comm, HYPRE_SStructSolver* solver)

Create a solver object

5.10.2

int HYPRE_SStructBiCGSTABDestroy (HYPRE_SStructSolver solver)

Destroy a solver object. An object should be explicitly destroyed using this destructor when the user’s code no longer needs direct access to it. Once destroyed, the object must not be referenced again. Note that the object may not be deallocated at the completion of this call, since there may be internal package references to the object. The object will then be destroyed when all internal reference counts go to zero.

5.11

SStruct LOBPCG Eigensolver

Names

5.11.1 int HYPRE_SStructSetupInterpreter (mv.InterfaceInterpreter* i)

Load interface interpreter. ................................................................. 125

5.11.2 int HYPRE_SStructSetupMatvec (HYPRE_MatvecFunctions* mv)

Load Matvec interpreter with hypre_SStructKrylov functions .............. 126

These routines should be used in conjunction with the generic interface in LOBPCG Eigensolver.

5.11.1

int HYPRE_SStructSetupInterpreter (mv.InterfaceInterpreter* i)
Load interface interpreter. Vector part loaded with hypre_SStructKrylov functions and multivector part loaded with mv_TempMultiVector functions.

5.1.1.2

```c
int HYPRE_SStructSetupMatvec (HYPRE_MatvecFunctions* mv)
```

Load Matvec interpreter with hypre_SStructKrylov functions
These solvers use matrix/vector storage schemes that are tailored for general sparse matrix systems.
6.1

ParCSR Solvers

Names
6.1.1

#define HYPRE_SOLVER_STRUCT

The solver object

6.2

ParCSR BoomerAMG Solver and Preconditioner

Names
6.2.1

int HYPRE_BoomerAMGCreate (HYPRE_Solver* solver)

Create a solver object

6.2.2

int HYPRE_BoomerAMGDestroy (HYPRE_Solver solver)

Destroy a solver object

6.2.3

int HYPRE_BoomerAMGSetup (HYPRE_Solver solver,
                          HYPRE_ParCSRMatrix A,
                          HYPRE_ParVector b,  HYPRE_ParVector x)

Set up the BoomerAMG solver or preconditioner

6.2.4

int HYPRE_BoomerAMGSolve (HYPRE_Solver solver,
                          HYPRE_ParCSRMatrix A,
                          HYPRE_ParVector b,  HYPRE_ParVector x)

Solve the system or apply AMG as a preconditioner

6.2.5

int
HYPRE_BoomerAMGSolveT (HYPRE_Solver solver,
HYPRE_ParCSRMatrix A,
HYPRE_ParVector b, HYPRE_ParVector x)

Solve the transpose system $A^T x = b$ or apply AMG as a preconditioner to
the transpose system.

6.2.6 int HYPRE_BoomerAMGSetTol (HYPRE_Solver solver, double tol)
(Optional) Set the convergence tolerance, if BoomerAMG is used as a solver.

6.2.7 int HYPRE_BoomerAMGSetMaxIter (HYPRE_Solver solver, int max_iter)
(Optional) Sets maximum number of iterations, if BoomerAMG is used as
a solver.

6.2.8 int HYPRE_BoomerAMGSetMaxLevels (HYPRE_Solver solver, int max_levels)
(Optional) Sets maximum number of multigrid levels.

6.2.9 int HYPRE_BoomerAMGSetMaxCoarseSize (HYPRE_Solver solver,
int max_coarse_size)
(Optional) Sets maximum size of coarsest grid.

6.2.10 int HYPRE_BoomerAMGSetMinCoarseSize (HYPRE_Solver solver,
int min_coarse_size)
(Optional) Sets minimum size of coarsest grid.

6.2.11 int HYPRE_BoomerAMGSetSeqThreshold (HYPRE_Solver solver,
int seq_threshold)
(Optional) Sets maximal size for redundant coarse grid solve.

6.2.12 int HYPRE_BoomerAMGSetStrongThreshold (HYPRE_Solver solver,
double strong_threshold)
(Optional) Sets AMG strength threshold.

6.2.13 int HYPRE_BoomerAMGSetMaxRowSum (HYPRE_Solver solver,
double max_row_sum)
(Optional) Sets a parameter to modify the definition of strength for diagonal
dominant portions of the matrix.

6.2.14 int HYPRE_BoomerAMGSetCoarsenType (HYPRE_Solver solver,
int coarsen_type)
(Optional) Defines which parallel coarsening algorithm is used.

6.2.15 int HYPRE_BoomerAMGSetMeasureType (HYPRE_Solver solver,
int measure_type)
(Optional) Defines whether local or global measures are used.

6.2.16 int
**HYPRE_BoomerAMGSetCycleType** (HYPRE_Solver solver, int cycle_type)

*(Optional) Defines the type of cycle.* ............................... 139

6.2.17

int

**HYPRE_BoomerAMGSetNumGridSweeps** (HYPRE_Solver solver, int* num_grid_sweeps)

*(Optional) Defines the number of sweeps for the fine and coarse grid, the up and down cycle.* .......................... 140

6.2.18

int

**HYPRE_BoomerAMGSetNumSweeps** (HYPRE_Solver solver, int num_sweeps)

*(Optional) Sets the number of sweeps.* .......................... 140

6.2.19

int

**HYPRE_BoomerAMGSetCycleNumSweeps** (HYPRE_Solver solver, int num_sweeps, int k)

*(Optional) Sets the number of sweeps at a specified cycle.* .......................... 140

6.2.20

int

**HYPRE_BoomerAMGSetGridRelaxType** (HYPRE_Solver solver, int* grid_relax_type)

*(Optional) Defines which smoother is used on the fine and coarse grid, the up and down cycle.* .......................... 140

6.2.21

int

**HYPRE_BoomerAMGSetRelaxType** (HYPRE_Solver solver, int relax_type)

*(Optional) Defines the smoother to be used.* .......................... 141

6.2.22

int

**HYPRE_BoomerAMGSetCycleRelaxType** (HYPRE_Solver solver, int relax_type, int k)

*(Optional) Defines the smoother at a given cycle.* .......................... 141

6.2.23

int

**HYPRE_BoomerAMGSetRelaxOrder** (HYPRE_Solver solver, int relax_order)

*(Optional) Defines in which order the points are relaxed.* .......................... 142

6.2.24

int

**HYPRE_BoomerAMGSetGridRelaxPoints** (HYPRE_Solver solver, int** grid_relax_points)

*(Optional) Defines in which order the points are relaxed.* .......................... 142

6.2.25

int

**HYPRE_BoomerAMGSetRelaxWeight** (HYPRE_Solver solver, double* relax_weight)

*(Optional) Defines the relaxation weight for smoothed Jacobi and hybrid SOR.* .......................... 142

6.2.26

int

**HYPRE_BoomerAMGSetRelaxWt** (HYPRE_Solver solver, double relax_weight)

*(Optional) Defines the relaxation weight for smoothed Jacobi and hybrid SOR on all levels.* .......................... 143

6.2.27

int
6.2.28 int HYPRE_BoomerAMGSetOmega (HYPRE_Solver solver, double* omega)  
(Optional) Defines the outer relaxation weight for hybrid SOR. .................. 143

6.2.29 int HYPRE_BoomerAMGSetOuterWt (HYPRE_Solver solver, double omega)  
(Optional) Defines the outer relaxation weight for hybrid SOR and SSOR on all levels. .......................... 144

6.2.30 int HYPRE_BoomerAMGSetLevelOuterWt (HYPRE_Solver solver, double omega, int level)  
(Optional) Defines the outer relaxation weight for hybrid SOR or SSOR on the user defined level. .................. 144

6.2.31 int HYPRE_BoomerAMGSetChebyOrder (HYPRE_Solver solver, int order)  
(Optional) Defines the Order for Chebyshev smoother. .................. 144

6.2.32 int HYPRE_BoomerAMGSetChebyFraction (HYPRE_Solver solver, double ratio)  
(Optional) Fraction of the spectrum to use for the Chebyshev smoother. .................. 144

6.2.33 int HYPRE_BoomerAMGSetDebugFlag (HYPRE_Solver solver, int debug_flag)  
(Optional) .................. 145

6.2.34 int HYPRE_BoomerAMGGetResidual (HYPRE_Solver solver, HYPRE_ParVector* residual)  
Returns the residual .................. 145

6.2.35 int HYPRE_BoomerAMGGetNumIterations (HYPRE_Solver solver, int* num_iterations)  
Returns the number of iterations taken .................. 145

6.2.36 int HYPRE_BoomerAMGGetFinalRelativeResidualNorm (HYPRE_Solver solver, double* rel_resid_norm)  
Returns the norm of the final relative residual .................. 145

6.2.37 int HYPRE_BoomerAMGSetTruncFactor (HYPRE_Solver solver, double trunc_factor)  
(Optional) Defines a truncation factor for the interpolation. .................. 146

6.2.38 int HYPRE_BoomerAMGSetPMaxElmts (HYPRE_Solver solver, int P_max_elmts)  
(Optional) Defines the maximal number of elements per row for the interpolation. .................. 146

6.2.39 int
6.2.40 int HYPRE_BoomerAMGSetInterpType (HYPRE_Solver solver, int interp_type)
(Optional) Defines which parallel interpolation operator is used. .............

6.2.41 int HYPRE_BoomerAMGSetSepWeight (HYPRE_Solver solver, int sep_weight)
(Optional) Defines whether separation of weights is used when defining strength for standard interpolation or multipass interpolation. .............

6.2.42 int HYPRE_BoomerAMGSetMinIter (HYPRE_Solver solver, int min_iter)
(Optional) .................................................................

6.2.43 int HYPRE_BoomerAMGInitGridRelaxation (int** num_grid_sweeps_ptr,
int** grid_relax_type_ptr,
int*** grid_relax_points_ptr,
int coarsen_type,
double** relax_weights_ptr,
int max_levels)
(Optional) This routine will be eliminated in the future .................

6.2.44 int HYPRE_BoomerAMGSetSmoothType (HYPRE_Solver solver, int smooth_type)
(Optional) Enables the use of more complex smoothers. .....................

6.2.45 int HYPRE_BoomerAMGSetSmoothNumLevels (HYPRE_Solver solver, int smooth_num_levels)
(Optional) Sets the number of levels for more complex smoothers. .......

6.2.46 int HYPRE_BoomerAMGSetSmoothNumSweeps (HYPRE_Solver solver, int smooth_num_sweeps)
(Optional) Sets the number of sweeps for more complex smoothers. .......

6.2.47 int HYPRE_BoomerAMGSetPrintLevel (HYPRE_Solver solver, int print_level)
(Optional) Requests automatic printing of setup and solve information. ..

6.2.48 int HYPRE_BoomerAMGSetLogging (HYPRE_Solver solver, int logging)
(Optional) Requests additional computations for diagnostic and similar data to be logged by the user. ..............................................

6.2.49 int HYPRE_BoomerAMGSetNumFunctions (HYPRE_Solver solver, int num_functions)
(Optional) Sets the size of the system of PDEs, if using the systems version.
.............................................................................

6.2.50 int
HYPRE_BoomerAMGSetNodal (HYPRE_Solver solver, int nodal)
  (Optional) Sets whether to use the nodal systems coarsening. .............

6.2.51 int

HYPRE_BoomerAMGSetDofFunc (HYPRE_Solver solver, int* dof_func)
  (Optional) Sets the mapping that assigns the function to each variable, if using the systems version. ........................................

6.2.52 int

HYPRE_BoomerAMGSetAggNumLevels (HYPRE_Solver solver, int agg_num_levels)
  (Optional) Defines the number of levels of aggressive coarsening. ..........

6.2.53 int

HYPRE_BoomerAMGSetAggInterpType (HYPRE_Solver solver, int agg_interp_type)
  (Optional) Defines the interpolation used on levels of aggressive coarsening. The default is 4, ie. .................................

6.2.54 int

HYPRE_BoomerAMGSetAggTruncFactor (HYPRE_Solver solver, double agg_trunc_factor)
  (Optional) Defines the truncation factor for the interpolation used for aggressive coarsening. .................................

6.2.55 int

HYPRE_BoomerAMGSetAggP12TruncFactor (HYPRE_Solver solver, double agg_P12_trunc_factor)
  (Optional) Defines the truncation factor for the matrices P1 and P2 which are used to build 2-stage interpolation. ..............

6.2.56 int

HYPRE_BoomerAMGSetAggPMaxElmts (HYPRE_Solver solver, int agg_P_max_elmts)
  (Optional) Defines the maximal number of elements per row for the interpolation used for aggressive coarsening. ..............

6.2.57 int

HYPRE_BoomerAMGSetAggP12MaxElmts (HYPRE_Solver solver, int agg_P12_max_elmts)
  (Optional) Defines the maximal number of elements per row for the matrices P1 and P2 which are used to build 2-stage interpolation. ..............

6.2.58 int

HYPRE_BoomerAMGSetNumPaths (HYPRE_Solver solver, int num_paths)
  (Optional) Defines the degree of aggressive coarsening. ....................

6.2.59 int

HYPRE_BoomerAMGSetVariant (HYPRE_Solver solver, int variant)
  (Optional) Defines which variant of the Schwarz method is used. .........

6.2.60 int

HYPRE_BoomerAMGSetOverlap (HYPRE_Solver solver, int overlap)
  (Optional) Defines the overlap for the Schwarz method. .................
6.2.62 int HYPRE_BoomerAMGSetSchwarzRlxWeight (HYPRE_Solver solver, double schwarz_rlx_weight) *(Optional)* Defines a smoothing parameter for the additive Schwarz method.

6.2.63 int HYPRE_BoomerAMGSetSchwarzUseNonSymm (HYPRE_Solver solver, int use_nonsymm) *(Optional)* Indicates that the aggregates may not be SPD for the Schwarz method.

6.2.64 int HYPRE_BoomerAMGSetSym (HYPRE_Solver solver, int sym) *(Optional)* Defines symmetry for ParaSAILS.

6.2.65 int HYPRE_BoomerAMGSetLevel (HYPRE_Solver solver, int level) *(Optional)* Defines number of levels for ParaSAILS.

6.2.66 int HYPRE_BoomerAMGSetThreshold (HYPRE_Solver solver, double threshold) *(Optional)* Defines threshold for ParaSAILS.

6.2.67 int HYPRE_BoomerAMGSetFilter (HYPRE_Solver solver, double filter) *(Optional)* Defines filter for ParaSAILS.

6.2.68 int HYPRE_BoomerAMGSetDropTol (HYPRE_Solver solver, double drop_tol) *(Optional)* Defines drop tolerance for PILUT.

6.2.69 int HYPRE_BoomerAMGSetMaxNzPerRow (HYPRE_Solver solver, int max_nz_per_row) *(Optional)* Defines maximal number of nonzeros for PILUT.

6.2.70 int HYPRE_BoomerAMGSetEuclidFile (HYPRE_Solver solver, char* euclidfile) *(Optional)* Defines name of an input file for Euclid parameters.

6.2.71 int HYPRE_BoomerAMGSetEuLevel (HYPRE_Solver solver, int eu_level) *(Optional)* Defines number of levels for ILU(k) in Euclid.

6.2.72 int HYPRE_BoomerAMGSetEuSparseA (HYPRE_Solver solver, double eu_sparse_A) *(Optional)* Defines filter for ILU(k) for Euclid.

6.2.73 int HYPRE_BoomerAMGSetEuBJ (HYPRE_Solver solver, int eu_bj) *(Optional)* Defines use of block jacobi ILUT for Euclid.
**HYPRE_BoomerAMGSetGSMG** (HYPRE_Solver solver, int gsmg)

*(Optional)* Specifies the use of GSMG - geometrically smooth coarsening and interpolation.

6.2.75 int **HYPRE_BoomerAMGSetNumSamples** (HYPRE_Solver solver, int num_samples)

*(Optional)* Defines the number of sample vectors used in GSMG or LS interpolation.

6.2.76 int **HYPRE_BoomerAMGSetCGCIts** (HYPRE_Solver solver, int its)

*(optional)* Defines the number of pathes for CGC-coarsening.

Parallel unstructured algebraic multigrid solver and preconditioner

**6.2.1**

int **HYPRE_BoomerAMGCreate** (HYPRE_Solver* solver)

Create a solver object

**6.2.2**

int **HYPRE_BoomerAMGDestroy** (HYPRE_Solver solver)

Destroy a solver object

**6.2.3**

int **HYPRE_BoomerAMGSetup** (HYPRE_Solver solver, HYPRE_ParCSRMatrix A, HYPRE_ParVector b, HYPRE_ParVector x)

Set up the BoomerAMG solver or preconditioner. If used as a preconditioner, this function should be passed to the iterative solver `SetPrecond` function.
Parameters: 

- **solver** [IN] object to be set up.
- **A** [IN] ParCSR matrix used to construct the solver/preconditioner.
- **b** Ignored by this function.
- **x** Ignored by this function.

### 6.2.4

```c
int HYPRE_BoomerAMGSolve (HYPRE_Solver solver, HYPRE_ParCSRMatrix A,
                          HYPRE_ParVector b, HYPRE_ParVector x)
```

Solve the system or apply AMG as a preconditioner. If used as a preconditioner, this function should be passed to the iterative solver `SetPrecond` function.

Parameters: 

- **solver** [IN] solver or preconditioner object to be applied.
- **A** [IN] ParCSR matrix, matrix of the linear system to be solved
- **b** [IN] right hand side of the linear system to be solved
- **x** [OUT] approximated solution of the linear system to be solved

### 6.2.5

```c
int HYPRE_BoomerAMGSolveT (HYPRE_Solver solver, HYPRE_ParCSRMatrix A,
                           HYPRE_ParVector b, HYPRE_ParVector x)
```

Solve the transpose system $A^T x = b$ or apply AMG as a preconditioner to the transpose system . Note that this function should only be used when preconditioning CGNR with BoomerAMG. It can only be used with Jacobi smoothing (relax_type 0 or 7) and without CF smoothing, i.e relax_order needs to be set to 0. If used as a preconditioner, this function should be passed to the iterative solver `SetPrecond` function.

Parameters: 

- **solver** [IN] solver or preconditioner object to be applied.
- **A** [IN] ParCSR matrix
- **b** [IN] right hand side of the linear system to be solved
- **x** [OUT] approximated solution of the linear system to be solved
6.2.6

```c
int HYPRE_BoomerAMGSetTol (HYPRE_Solver solver, double tol)
```

(Optional) Set the convergence tolerance, if BoomerAMG is used as a solver. If it is used as a preconditioner, it should be set to 0. The default is 1.e-7.

6.2.7

```c
int HYPRE_BoomerAMGSetMaxIter (HYPRE_Solver solver, int max_iter)
```

(Optional) Sets maximum number of iterations, if BoomerAMG is used as a solver. If it is used as a preconditioner, it should be set to 1. The default is 20.

6.2.8

```c
int HYPRE_BoomerAMGSetMaxLevels (HYPRE_Solver solver, int max_levels)
```

(Optional) Sets maximum number of multigrid levels. The default is 25.

6.2.9

```c
int HYPRE_BoomerAMGSetMaxCoarseSize (HYPRE_Solver solver, int max_coarse_size)
```

(Optional) Sets maximum size of coarsest grid. The default is 9.
6.2.10

```
int HYPRE_BoomerAMGSetMinCoarseSize (HYPRE_Solver solver, int min_coarse_size)
```

(Optional) Sets minimum size of coarsest grid. The default is 1.

6.2.11

```
int HYPRE_BoomerAMGSetSeqThreshold (HYPRE_Solver solver, int seq_threshold)
```

(Optional) Sets maximal size for redundant coarse grid solve. When the system is smaller than this threshold, sequential AMG is used on all remaining active processors.

6.2.12

```
int HYPRE_BoomerAMGSetStrongThreshold (HYPRE_Solver solver, double strong_threshold)
```

(Optional) Sets AMG strength threshold. The default is 0.25. For 2d Laplace operators, 0.25 is a good value, for 3d Laplace operators, 0.5 or 0.6 is a better value. For elasticity problems, a large strength threshold, such as 0.9, is often better.

6.2.13

```
int HYPRE_BoomerAMGSetMaxRowSum (HYPRE_Solver solver, double max_row_sum)
```

(Optional) Sets a parameter to modify the definition of strength for diagonal dominant portions of the matrix. The default is 0.9. If max_row_sum is 1, no checking for diagonally dominant rows is performed.
6.2.14

int

**HYPRE_BoomerAMGSetCoarsenType** (HYPRE_Solver solver, int
coarsen_type)

(Optional) Defines which parallel coarsening algorithm is used. There are the following options for coarsen_type:

- 0: CLJP-coarsening (a parallel coarsening algorithm using independent sets).
- 1: classical Ruge-Stueben coarsening on each processor, no boundary treatment (not recommended!)
- 2: CLJP-coarsening (using a fixed random vector, for debugging purposes only)
- 3: classical Ruge-Stueben coarsening on each processor, followed by a third pass, which adds coarse points on the boundaries
- 4: Falgout coarsening (uses 1 first, followed by CLJP using the interior coarse points generated by 1 as its first independent set)
- 5: CLJP-coarsening (using a fixed random vector, for debugging purposes only)
- 6: PMIS-coarsening (a parallel coarsening algorithm using independent sets, generating lower complexities than CLJP, might also lead to slower convergence)
- 7: PMIS-coarsening (using a fixed random vector, for debugging purposes only)
- 8: HMIS-coarsening (uses one pass Ruge-Stueben on each processor independently, followed by PMIS using the interior C-points generated as its first independent set)
- 9: one-pass Ruge-Stueben coarsening on each processor, no boundary treatment (not recommended!)
- 10: CGC coarsening by M. Griebel, B. Metsch and A. Schweitzer
- 11: CGC-E coarsening by M. Griebel, B. Metsch and A. Schweitzer

The default is 6.

6.2.15

int

**HYPRE_BoomerAMGSetMeasureType** (HYPRE_Solver solver, int
measure_type)

(Optional) Defines whether local or global measures are used

6.2.16

int

**HYPRE_BoomerAMGSetCycleType** (HYPRE_Solver solver, int cycle_type)

(Optional) Defines the type of cycle. For a V-cycle, set cycle_type to 1, for a W-cycle set cycle_type to 2. The default is 1.
### 6.2.17

```c
int HYPRE_BoomerAMGSetNumGridSweeps (HYPRE_Solver solver, int* num_grid_sweeps)
```

(Optional) Defines the number of sweeps for the fine and coarse grid, the up and down cycle.

Note: This routine will be phased out!!!! Use HYPRE_BoomerAMGSetNumSweeps or HYPRE_BoomerAMGSetCycleNumSweeps instead.

### 6.2.18

```c
int HYPRE_BoomerAMGSetNumSweeps (HYPRE_Solver solver, int num_sweeps)
```

(Optional) Sets the number of sweeps. On the finest level, the up and the down cycle the number of sweeps are set to num_sweeps and on the coarsest level to 1. The default is 1.

### 6.2.19

```c
int HYPRE_BoomerAMGSetCycleNumSweeps (HYPRE_Solver solver, int num_sweeps, int k)
```

(Optional) Sets the number of sweeps at a specified cycle. There are the following options for k:

<table>
<thead>
<tr>
<th>Cycle Type</th>
<th>k</th>
</tr>
</thead>
<tbody>
<tr>
<td>The down cycle</td>
<td>1</td>
</tr>
<tr>
<td>The up cycle</td>
<td>2</td>
</tr>
<tr>
<td>The coarsest level</td>
<td>3</td>
</tr>
</tbody>
</table>

### 6.2.20

```c
int HYPRE_BoomerAMGSetGridRelaxType (HYPRE_Solver solver, int* grid_relax_type)
```
(Optional) Defines which smoother is used on the fine and coarse grid, the up and down cycle.

Note: This routine will be phased out!!!! Use HYPRE_BoomerAMGSetRelaxType or HYPRE_BoomerAMGSetCycleRelaxType instead.

### 6.2.21

```c
int HYPRE_BoomerAMGSetRelaxType (HYPRE_Solver solver, int relax_type)
```

(Optional) Defines the smoother to be used. It uses the given smoother on the fine grid, the up and the down cycle and sets the solver on the coarsest level to Gaussian elimination (9). The default is Gauss-Seidel (3).

There are the following options for `relax_type`:

<table>
<thead>
<tr>
<th>relax_type</th>
<th>Smoother</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Jacobi</td>
</tr>
<tr>
<td>1</td>
<td>Gauss-Seidel, sequential (very slow!)</td>
</tr>
<tr>
<td>2</td>
<td>Gauss-Seidel, interior points in parallel, boundary sequential (slow!)</td>
</tr>
<tr>
<td>3</td>
<td>hybrid Gauss-Seidel or SOR, forward solve</td>
</tr>
<tr>
<td>4</td>
<td>hybrid Gauss-Seidel or SOR, backward solve</td>
</tr>
<tr>
<td>5</td>
<td>hybrid chaotic Gauss-Seidel (works only with OpenMP)</td>
</tr>
<tr>
<td>6</td>
<td>hybrid symmetric Gauss-Seidel or SSOR</td>
</tr>
<tr>
<td>8</td>
<td>$\ell_1$-scaled hybrid symmetric Gauss-Seidel</td>
</tr>
<tr>
<td>9</td>
<td>Gaussian elimination (only on coarsest level)</td>
</tr>
<tr>
<td>15</td>
<td>CG (warning - not a fixed smoother - may require FGMRES)</td>
</tr>
<tr>
<td>16</td>
<td>Chebyshev</td>
</tr>
<tr>
<td>17</td>
<td>FCF-Jacobi</td>
</tr>
<tr>
<td>18</td>
<td>$\ell_1$-scaled jacobi</td>
</tr>
</tbody>
</table>

### 6.2.22

```c
int HYPRE_BoomerAMGSetCycleRelaxType (HYPRE_Solver solver, int relax_type, int k)
```

(Optional) Defines the smoother at a given cycle. For options of `relax_type` see description of HYPRE_BoomerAMGSetRelaxType). Options for k are

<table>
<thead>
<tr>
<th>k</th>
<th>Cycle</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>The down cycle</td>
</tr>
<tr>
<td>2</td>
<td>The up cycle</td>
</tr>
<tr>
<td>3</td>
<td>The coarsest level</td>
</tr>
</tbody>
</table>
6.2.23

```c
int HYPRE_BoomerAMGSetRelaxOrder (HYPRE_Solver solver, int relax_order)
```

(Optional) Defines in which order the points are relaxed. There are the following options for `relax_order`:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>The points are relaxed in natural or lexicographic order on each processor.</td>
</tr>
<tr>
<td>1</td>
<td>CF-relaxation is used, i.e. on the fine grid and the down cycle the coarse points are relaxed first, followed by the fine points; on the up cycle the F-points are relaxed first, followed by the C-points. On the coarsest level, if an iterative scheme is used, the points are relaxed in lexicographic order.</td>
</tr>
</tbody>
</table>

The default is 1 (CF-relaxation).

6.2.24

```c
int HYPRE_BoomerAMGSetGridRelaxPoints (HYPRE_Solver solver, int** grid_relax_points)
```

(Optional) Defines in which order the points are relaxed.

Note: This routine will be phased out!!! Use HYPRE_BoomerAMGSetRelaxOrder instead.

6.2.25

```c
int HYPRE_BoomerAMGSetRelaxWeight (HYPRE_Solver solver, double* relax_weight)
```

(Optional) Defines the relaxation weight for smoothed Jacobi and hybrid SOR.

Note: This routine will be phased out!!! Use HYPRE_BoomerAMGSetRelaxWt or HYPRE_BoomerAMGSetLevelRelaxWt instead.
6.2.26

```
int HYPRE_BoomerAMGSetRelaxWt (HYPRE_Solver solver, double relax_weight)
```

(Optional) Defines the relaxation weight for smoothed Jacobi and hybrid SOR on all levels.

<table>
<thead>
<tr>
<th>relax_weight &gt; 0</th>
<th>this assigns the given relaxation weight on all levels</th>
</tr>
</thead>
<tbody>
<tr>
<td>relax_weight = 0</td>
<td>the weight is determined on each level with the estimate $\frac{3}{4|D^{1/2}AD^{1/2}|}$, where $D$ is the diagonal matrix of $A$ (this should only be used with Jacobi)</td>
</tr>
<tr>
<td>relax_weight = -k</td>
<td>the relaxation weight is determined with at most $k$ CG steps on each level (this should only be used for symmetric positive definite problems)</td>
</tr>
</tbody>
</table>

The default is 1.

6.2.27

```
int HYPRE_BoomerAMGSetLevelRelaxWt (HYPRE_Solver solver, double relax_weight, int level)
```

(Optional) Defines the relaxation weight for smoothed Jacobi and hybrid SOR on the user defined level. Note that the finest level is denoted 0, the next coarser level 1, etc. For nonpositive relax_weight, the parameter is determined on the given level as described for HYPRE_BoomerAMGSetRelaxWt. The default is 1.

6.2.28

```
int HYPRE_BoomerAMGSetOmega (HYPRE_Solver solver, double* omega)
```

(Optional) Defines the outer relaxation weight for hybrid SOR. Note: This routine will be phased out!!!! Use HYPRE_BoomerAMGSetOuterWt or HYPRE_BoomerAMGSetLevelOuterWt instead.
6.2.29

```c
int HYPRE_BoomerAMGSetOuterWt (HYPRE_Solver solver, double omega)
```

(Optional) Defines the outer relaxation weight for hybrid SOR and SSOR on all levels.

- `omega > 0` this assigns the same outer relaxation weight `omega` on each level
- `omega = -k` an outer relaxation weight is determined with at most `k` CG steps on each level
  (this only makes sense for symmetric positive definite problems and smoothers, e.g. SSOR)

The default is 1.

6.2.30

```c
int HYPRE_BoomerAMGSetLevelOuterWt (HYPRE_Solver solver, double omega, int level)
```

(Optional) Defines the outer relaxation weight for hybrid SOR or SSOR on the user defined level. Note that the finest level is denoted 0, the next coarser level 1, etc. For nonpositive `omega`, the parameter is determined on the given level as described for `HYPRE_BoomerAMGSetOuterWt`. The default is 1.

6.2.31

```c
int HYPRE_BoomerAMGSetChebyOrder (HYPRE_Solver solver, int order)
```

(Optional) Defines the Order for Chebyshev smoother. The default is 2 (valid options are 1-4).

6.2.32

```c
int HYPRE_BoomerAMGSetChebyFraction (HYPRE_Solver solver, double ratio)
```

(Optional) Fraction of the spectrum to use for the Chebyshev smoother. The default is .3 (i.e., damp on upper 30% of the spectrum).
6.2.33

```c
int HYPRE_BoomerAMGSetDebugFlag (HYPRE_Solver solver, int debug_flag)
```

(Optional)

6.2.34

```c
int HYPRE_BoomerAMGGetResidual (HYPRE_Solver solver,
HYPRE_ParVector* residual)
```

Returns the residual

6.2.35

```c
int HYPRE_BoomerAMGGetNumIterations (HYPRE_Solver solver, int*
num_iterations)
```

Returns the number of iterations taken

6.2.36

```c
int HYPRE_BoomerAMGGetFinalRelativeResidualNorm (HYPRE_Solver
solver, double* rel_resid_norm)
```

Returns the norm of the final relative residual
6.2.37

```c
int HYPRE_BoomerAMGSetTruncFactor (HYPRE_Solver solver, double trunc_factor)
```

(Optional) Defines a truncation factor for the interpolation. The default is 0.

6.2.38

```c
int HYPRE_BoomerAMGSetPMaxElmts (HYPRE_Solver solver, int P_max_elmts)
```

(Optional) Defines the maximal number of elements per row for the interpolation. The default is 0.

6.2.39

```c
int HYPRE_BoomerAMGSetSCommPkgSwitch (HYPRE_Solver solver, double S_commpkg_switch)
```

(Optional) Defines the largest strength threshold for which the strength matrix S uses the communication package of the operator A. If the strength threshold is larger than this values, a communication package is generated for S. This can save memory and decrease the amount of data that needs to be communicated, if S is substantially sparser than A. The default is 1.0.

6.2.40

```c
int HYPRE_BoomerAMGSetInterpType (HYPRE_Solver solver, int interp_type)
```

(Optional) Defines which parallel interpolation operator is used. There are the following options for interp_type:
6.2.41

```c
int HYPRE_BoomerAMGSetSepWeight (HYPRE_Solver solver, int sep_weight)
```

(Optional) Defines whether separation of weights is used when defining strength for standard interpolation or multipass interpolation. Default: 0, i.e. no separation of weights used.

6.2.42

```c
int HYPRE_BoomerAMGSetMinIter (HYPRE_Solver solver, int min_iter)
```

(Optional)

6.2.43

```c
int HYPRE_BoomerAMGInitGridRelaxation (int** num_grid_sweeps_ptr, int** grid_relax_type_ptr, int*** grid_relax_points_ptr, int coarsen_type, double** relax_weights_ptr, int max_levels)
```

The default is 0.
(Optional) This routine will be eliminated in the future

6.2.44

```
int HYPRE_BoomerAMGSetSmoothType (HYPRE_Solver solver, int smooth_type)
```

(Optional) Enables the use of more complex smoothers. The following options exist for smooth_type:

<table>
<thead>
<tr>
<th>value</th>
<th>smoother</th>
<th>routines needed to set smoother parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>Schwarz</td>
<td>HYPRE_BoomerAMGSetDomainType, HYPRE_BoomerAMGSetOverlap, HYPRE_BoomerAMGSetVariant, HYPRE_BoomerAMGSetSchwarzRlxWeight</td>
</tr>
<tr>
<td>7</td>
<td>Pilut</td>
<td>HYPRE_BoomerAMGSetDropTol, HYPRE_BoomerAMGSetMaxNzPerRow</td>
</tr>
<tr>
<td>8</td>
<td>ParaSails</td>
<td>HYPRE_BoomerAMGSetSym, HYPRE_BoomerAMGSetLevel, HYPRE_BoomerAMGSetFilter, HYPRE_BoomerAMGSetThreshold</td>
</tr>
<tr>
<td>9</td>
<td>Euclid</td>
<td>HYPRE_BoomerAMGSetEuclidFile</td>
</tr>
</tbody>
</table>

The default is 6. Also, if no smoother parameters are set via the routines mentioned in the table above, default values are used.

6.2.45

```
int HYPRE_BoomerAMGSetSmoothNumLevels (HYPRE_Solver solver, int smooth_num_levels)
```

(Optional) Sets the number of levels for more complex smoothers. The smoothers, as defined by HYPRE_BoomerAMGSetSmoothType, will be used on level 0 (the finest level) through level smooth_num_levels-1. The default is 0, i.e. no complex smoothers are used.

6.2.46

```
int HYPRE_BoomerAMGSetSmoothNumSweeps (HYPRE_Solver solver, int smooth_num_sweeps)
```

(Optional) Sets the number of sweeps for more complex smoothers. The default is 1.
6.2.47  

`int HYPRE_BoomerAMGSetPrintLevel (HYPRE_Solver solver, int print_level)`

(Optional) Requests automatic printing of setup and solve information.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>no printout (default)</td>
</tr>
<tr>
<td>1</td>
<td>print setup information</td>
</tr>
<tr>
<td>2</td>
<td>print solve information</td>
</tr>
<tr>
<td>3</td>
<td>print both setup and solve information</td>
</tr>
</tbody>
</table>

Note, that if one desires to print information and uses BoomerAMG as a preconditioner, suggested `print_level` is 1 to avoid excessive output, and use `print_level` of solver for solve phase information.

6.2.48

`int HYPRE_BoomerAMGSetLogging (HYPRE_Solver solver, int logging)`

(Optional) Requests additional computations for diagnostic and similar data to be logged by the user. Default to 0 for do nothing. The latest residual will be available if `logging > 1`.

6.2.49

`int HYPRE_BoomerAMGSetNumFunctions (HYPRE_Solver solver, int num_functions)`

(Optional) Sets the size of the system of PDEs, if using the systems version. The default is 1.

6.2.50

`int HYPRE_BoomerAMGSetNodal (HYPRE_Solver solver, int nodal)`

(Optional) Sets whether to use the nodal systems coarsening. The default is 0 (unknown-based coarsening).
6.2.51

```c
int HYPRE_BoomerAMGSetDofFunc (HYPRE_Solver solver, int* dof_func)
```

(Optional) Sets the mapping that assigns the function to each variable, if using the systems version. If no assignment is made and the number of functions is \( k > 1 \), the mapping generated is \((0,1,...,k-1,0,1,...,k-1,...)\).

6.2.52

```c
int HYPRE_BoomerAMGSetAggNumLevels (HYPRE_Solver solver, int agg_num_levels)
```

(Optional) Defines the number of levels of aggressive coarsening. The default is 0, i.e. no aggressive coarsening.

6.2.53

```c
int HYPRE_BoomerAMGSetAggInterpType (HYPRE_Solver solver, int agg_interp_type)
```

(Optional) Defines the interpolation used on levels of aggressive coarsening. The default is 4, i.e. multipass interpolation. The following options exist:

<table>
<thead>
<tr>
<th>Option</th>
<th>Interpolation Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2-stage extended+i interpolation</td>
</tr>
<tr>
<td>2</td>
<td>2-stage standard interpolation</td>
</tr>
<tr>
<td>3</td>
<td>2-stage extended interpolation</td>
</tr>
<tr>
<td>4</td>
<td>multipass interpolation</td>
</tr>
</tbody>
</table>

6.2.54

```c
int HYPRE_BoomerAMGSetAggTruncFactor (HYPRE_Solver solver, double agg_trunc_factor)
```
(Optional) Defines the truncation factor for the interpolation used for aggressive coarsening. The default is 0.

6.2.55

```c
int HYPRE_BoomerAMGSetAggP12TruncFactor (HYPRE_Solver solver, double agg_P12_trunc_factor)
```

(Optional) Defines the truncation factor for the matrices P1 and P2 which are used to build 2-stage interpolation. The default is 0.

6.2.56

```c
int HYPRE_BoomerAMGSetAggPMaxElmts (HYPRE_Solver solver, int agg_P_max_elmts)
```

(Optional) Defines the maximal number of elements per row for the interpolation used for aggressive coarsening. The default is 0.

6.2.57

```c
int HYPRE_BoomerAMGSetAggP12MaxElmts (HYPRE_Solver solver, int agg_P12_max_elmts)
```

(Optional) Defines the maximal number of elements per row for the matrices P1 and P2 which are used to build 2-stage interpolation. The default is 0.
6.2.58

```c
int HYPRE_BoomerAMGSetNumPaths (HYPRE_Solver solver, int num_paths)
```

(Optional) Defines the degree of aggressive coarsening. The default is 1.

6.2.59

```c
int HYPRE_BoomerAMGSetVariant (HYPRE_Solver solver, int variant)
```

(Optional) Defines which variant of the Schwarz method is used. The following options exist for variant:

<table>
<thead>
<tr>
<th>Variant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>hybrid multiplicative Schwarz method (no overlap across processor boundaries)</td>
</tr>
<tr>
<td>1</td>
<td>hybrid additive Schwarz method (no overlap across processor boundaries)</td>
</tr>
<tr>
<td>2</td>
<td>additive Schwarz method</td>
</tr>
<tr>
<td>3</td>
<td>hybrid multiplicative Schwarz method (with overlap across processor boundaries)</td>
</tr>
</tbody>
</table>

The default is 0.

6.2.60

```c
int HYPRE_BoomerAMGSetOverlap (HYPRE_Solver solver, int overlap)
```

(Optional) Defines the overlap for the Schwarz method. The following options exist for overlap:

<table>
<thead>
<tr>
<th>Overlap</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>no overlap</td>
</tr>
<tr>
<td>1</td>
<td>minimal overlap (default)</td>
</tr>
<tr>
<td>2</td>
<td>overlap generated by including all neighbors of domain boundaries</td>
</tr>
</tbody>
</table>

6.2.61

```c
int HYPRE_BoomerAMGSetDomainType (HYPRE_Solver solver, int domain_type)
```
(Optional) Defines the type of domain used for the Schwarz method. The following options exist for domain_type:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>each point is a domain</td>
</tr>
<tr>
<td>1</td>
<td>each node is a domain (only of interest in &quot;systems&quot; AMG)</td>
</tr>
<tr>
<td>2</td>
<td>each domain is generated by agglomeration (default)</td>
</tr>
</tbody>
</table>

6.2.62

```c
int HYPRE_BoomerAMGSetSchwarzRlxWeight (HYPRE_Solver solver, double schwarz_rlx_weight)
```

(Optional) Defines a smoothing parameter for the additive Schwarz method

6.2.63

```c
int HYPRE_BoomerAMGSetSchwarzUseNonSymm (HYPRE_Solver solver, int use_nonsymm)
```

(Optional) Indicates that the aggregates may not be SPD for the Schwarz method. The following options exist for use_nonsymm:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>assume SPD (default)</td>
</tr>
<tr>
<td>1</td>
<td>assume non-symmetric</td>
</tr>
</tbody>
</table>

6.2.64

```c
int HYPRE_BoomerAMGSetSym (HYPRE_Solver solver, int sym)
```

(Optional) Defines symmetry for ParaSAILS. For further explanation see description of ParaSAILS.
6.2.65

```
int HYPRE_BoomerAMGSetLevel (HYPRE_Solver solver, int level)
```

(Optional) Defines number of levels for ParaSAILS. For further explanation see description of ParaSAILS.

6.2.66

```
int HYPRE_BoomerAMGSetThreshold (HYPRE_Solver solver, double threshold)
```

(Optional) Defines threshold for ParaSAILS. For further explanation see description of ParaSAILS.

6.2.67

```
int HYPRE_BoomerAMGSetFilter (HYPRE_Solver solver, double filter)
```

(Optional) Defines filter for ParaSAILS. For further explanation see description of ParaSAILS.

6.2.68

```
int HYPRE_BoomerAMGSetDropTol (HYPRE_Solver solver, double drop_tol)
```

(Optional) Defines drop tolerance for PILUT. For further explanation see description of PILUT.

6.2.69

```
int HYPRE_BoomerAMGSetMaxNzPerRow (HYPRE_Solver solver, int max_nz_per_row)
```
(Optional) Defines maximal number of nonzeros for PILUT. For further explanation see description of PILUT.

6.2.70

```
int HYPRE_BoomerAMGSetEuclidFile (HYPRE_Solver solver, char* euclidfile)
```

(Optional) Defines name of an input file for Euclid parameters. For further explanation see description of Euclid.

6.2.71

```
int HYPRE_BoomerAMGSetEuLevel (HYPRE_Solver solver, int eu_level)
```

(Optional) Defines number of levels for ILU(k) in Euclid. For further explanation see description of Euclid.

6.2.72

```
int HYPRE_BoomerAMGSetEuSparseA (HYPRE_Solver solver, double eu_sparse_A)
```

(Optional) Defines filter for ILU(k) for Euclid. For further explanation see description of Euclid.

6.2.73

```
int HYPRE_BoomerAMGSetEuBJ (HYPRE_Solver solver, int eu_bj)
```

(Optional) Defines use of block jacobi ILUT for Euclid. For further explanation see description of Euclid.
6.2.74

int HYPRE_BoomerAMGSetGSMG (HYPRE_Solver solver, int gsng)

(Optional) Specifies the use of GSMG - geometrically smooth coarsening and interpolation. Currently any nonzero value for gsng will lead to the use of GSMG. The default is 0, i.e. (GSMG is not used)

6.2.75

int HYPRE_BoomerAMGSetNumSamples (HYPRE_Solver solver, int num_samples)

(Optional) Defines the number of sample vectors used in GSMG or LS interpolation

6.2.76

int HYPRE_BoomerAMGSetCGCIts (HYPRE_Solver solver, int its)

(Optional) Defines the number of paths for CGC-coarsening

6.3

ParCSR ParaSails Preconditioner

Names

6.3.1 int HYPRE_ParaSailsCreate (MPI_Comm comm, HYPRE_Solver* solver)
        Create a ParaSails preconditioner ........................................ 157

6.3.2 int HYPRE_ParaSailsDestroy (HYPRE_Solver solver)
        Destroy a ParaSails preconditioner ....................................... 157

6.3.3 int HYPRE_ParaSailsSetup (HYPRE_Solver solver, HYPRE_ParCSRMatrix A,
        HYPRE_ParVector b, HYPRE_ParVector x)
        Set up the ParaSails preconditioner. ..................................... 158

6.3.4 int
**HYPRE_ParaSailsSolve** (HYPRE_Solver solver, HYPRE_ParCSRMatrix A, HYPRE_ParVector b, HYPRE_ParVector x)

*Apply the ParaSails preconditioner.*

6.3.5

int **HYPRE_ParaSailsSetParams** (HYPRE_Solver solver, double thresh, int nlevels)

*Set the threshold and levels parameter for the ParaSails preconditioner.*

6.3.6

int **HYPRE_ParaSailsSetFilter** (HYPRE_Solver solver, double filter)

*Set the filter parameter for the ParaSails preconditioner.*

6.3.7

int **HYPRE_ParaSailsSetSym** (HYPRE_Solver solver, int sym)

*Set the symmetry parameter for the ParaSails preconditioner.*

6.3.8

int **HYPRE_ParaSailsSetLoadbal** (HYPRE_Solver solver, double loadbal)

*Set the load balance parameter for the ParaSails preconditioner.*

6.3.9

int **HYPRE_ParaSailsSetReuse** (HYPRE_Solver solver, int reuse)

*Set the pattern reuse parameter for the ParaSails preconditioner.*

6.3.10

int **HYPRE_ParaSailsSetLogging** (HYPRE_Solver solver, int logging)

*Set the logging parameter for the ParaSails preconditioner.*

6.3.11

int **HYPRE_ParaSailsBuildIJMatrix** (HYPRE_Solver solver, HYPRE_IJMatrix* pij_A)

*Build IJ Matrix of the sparse approximate inverse (factor).*

Parallel sparse approximate inverse preconditioner for the ParCSR matrix format.

6.3.1

int **HYPRE_ParaSailsCreate** (MPI_Comm comm, HYPRE_Solver* solver)

Create a ParaSails preconditioner

6.3.2

int **HYPRE_ParaSailsDestroy** (HYPRE_Solver solver)

Destroy a ParaSails preconditioner
6.3.3

```c
int HYPRE_ParaSailsSetup (HYPRE_Solver solver, HYPRE_ParCSRMatrix A,
                            HYPRE_ParVector b, HYPRE_ParVector x)
```

Set up the ParaSails preconditioner. This function should be passed to the iterative solver `SetPrecond` function.

**Parameters:**
- `solver` [IN] Preconditioner object to set up.
- `A` [IN] ParCSR matrix used to construct the preconditioner.
- `b` Ignored by this function.
- `x` Ignored by this function.

6.3.4

```c
int HYPRE_ParaSailsSolve (HYPRE_Solver solver, HYPRE_ParCSRMatrix A,
                           HYPRE_ParVector b, HYPRE_ParVector x)
```

Apply the ParaSails preconditioner. This function should be passed to the iterative solver `SetPrecond` function.

**Parameters:**
- `solver` [IN] Preconditioner object to apply.
- `A` Ignored by this function.
- `b` [IN] Vector to precondition.
- `x` [OUT] Preconditioned vector.

6.3.5

```c
int HYPRE_ParaSailsSetParams (HYPRE_Solver solver, double thresh, int nlevels)
```

Set the threshold and levels parameter for the ParaSails preconditioner. The accuracy and cost of ParaSails are parameterized by these two parameters. Lower values of the threshold parameter and higher values of levels parameter lead to more accurate, but more expensive preconditioners.
Parameters:

- **solver** [IN] Preconditioner object for which to set parameters.
- **thresh** [IN] Value of threshold parameter, $0 \leq \text{thresh} \leq 1$. The default value is 0.1.
- **nlevels** [IN] Value of levels parameter, $0 \leq \text{nlevels}$. The default value is 1.

### 6.3.6

```c
int HYPRE_ParaSailsSetFilter (HYPRE_Solver solver, double filter)
```

Set the filter parameter for the ParaSails preconditioner.

Parameters:

- **solver** [IN] Preconditioner object for which to set filter parameter.
- **filter** [IN] Value of filter parameter. The filter parameter is used to drop small nonzeros in the preconditioner, to reduce the cost of applying the preconditioner. Values from 0.05 to 0.1 are recommended. The default value is 0.1.

### 6.3.7

```c
int HYPRE_ParaSailsSetSym (HYPRE_Solver solver, int sym)
```

Set the symmetry parameter for the ParaSails preconditioner.

Parameters:

- **solver** [IN] Preconditioner object for which to set symmetry parameter.
- **sym** [IN] Value of the symmetry parameter:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Nonsymmetric and/or indefinite problem, and nonsymmetric preconditioner</td>
</tr>
<tr>
<td>1</td>
<td>SPD problem, and SPD (factored) preconditioner</td>
</tr>
<tr>
<td>2</td>
<td>Nonsymmetric, definite problem, and SPD (factored) preconditioner</td>
</tr>
</tbody>
</table>
6.3.8

\textbf{int} \texttt{HYPRE\_ParaSailsSetLoadbal} (HYPRE\_Solver solver, double loadbal)

Set the load balance parameter for the ParaSails preconditioner.

**Parameters:**
- \texttt{solver} [IN] Preconditioner object for which to set the load balance parameter.
- \texttt{loadbal} [IN] Value of the load balance parameter, $0 \leq \texttt{loadbal} \leq 1$. A zero value indicates that no load balance is attempted; a value of unity indicates that perfect load balance will be attempted. The recommended value is 0.9 to balance the overhead of data exchanges for load balancing. No load balancing is needed if the preconditioner is very sparse and fast to construct. The default value when this parameter is not set is 0.

6.3.9

\textbf{int} \texttt{HYPRE\_ParaSailsSetReuse} (HYPRE\_Solver solver, int reuse)

Set the pattern reuse parameter for the ParaSails preconditioner.

**Parameters:**
- \texttt{solver} [IN] Preconditioner object for which to set the pattern reuse parameter.
- \texttt{reuse} [IN] Value of the pattern reuse parameter. A nonzero value indicates that the pattern of the preconditioner should be reused for subsequent constructions of the preconditioner. A zero value indicates that the preconditioner should be constructed from scratch. The default value when this parameter is not set is 0.

6.3.10

\textbf{int} \texttt{HYPRE\_ParaSailsSetLogging} (HYPRE\_Solver solver, int logging)

Set the logging parameter for the ParaSails preconditioner.
Parameters:

- **solver** [IN] Preconditioner object for which to set the logging-parameter.
- **logging** [IN] Value of the logging parameter. A nonzero value sends statistics of the setup procedure to stdout. The default value when this parameter is not set is 0.

### 6.3.11

```c
int HYPRE_ParaSailsBuildIJMatrix (HYPRE_Solver solver, HYPRE_IJMatrix* pij_A)
```

Build IJ Matrix of the sparse approximate inverse (factor). This function explicitly creates the IJ Matrix corresponding to the sparse approximate inverse or the inverse factor. Example: `HYPRE_IJMatrix ij_A; HYPRE_ParaSailsBuildIJMatrix(solver, &ij_A);`

Parameters:

- **solver** [IN] Preconditioner object.
- **pij_A** [OUT] Pointer to the IJ Matrix.

### 6.4

**ParCSR Euclid Preconditioner**

Names

- **6.4.1**
  ```c
  int HYPRE_EuclidCreate (MPI_Comm comm, HYPRE_Solver* solver)
  
  Create a Euclid object .................................................................
  ```

- **6.4.2**
  ```c
  int HYPRE_EuclidDestroy (HYPRE_Solver solver)
  
  Destroy a Euclid object .............................................................
  ```

- **6.4.3**
  ```c
  int HYPRE_EuclidSetup (HYPRE_Solver solver, HYPRE_ParCSRMatrix A, 
                          HYPRE_ParVector b, HYPRE_ParVector x)
  
  Set up the Euclid preconditioner. .................................................
  ```

- **6.4.4**
  ```c
  int HYPRE_EuclidSolve (HYPRE_Solver solver, HYPRE_ParCSRMatrix A, 
                         HYPRE_ParVector b, HYPRE_ParVector x)
  
  Apply the Euclid preconditioner. ...................................................
  ```
**HYPRE_EuclidSetParams** (HYPRE_Solver solver, int argc, char* argv[])

*Insert (name, value) pairs in Euclid’s options database by passing Euclid the command line (or an array of strings).*  

**HYPRE_EuclidSetParamsFromFile** (HYPRE_Solver solver, char* filename)

*Insert (name, value) pairs in Euclid’s options database.*

**HYPRE_EuclidSetLevel** (HYPRE_Solver solver, int level)

*Set level k for ILU(k) factorization, default: 1*

**HYPRE_EuclidSetBJ** (HYPRE_Solver solver, int bj)

*Use block Jacobi ILU preconditioning instead of PILU*

**HYPRE_EuclidSetStats** (HYPRE_Solver solver, int eu_stats)

*If eu_stats not equal 0, a summary of runtime settings and timing information is printed to stdout*

**HYPRE_EuclidSetMem** (HYPRE_Solver solver, int eu_mem)

*If eu_mem not equal 0, a summary of Euclid’s memory usage is printed to stdout*

**HYPRE_EuclidSetSparseA** (HYPRE_Solver solver, double sparse_A)

*Defines a drop tolerance for ILU(k).*

**HYPRE_EuclidSetRowScale** (HYPRE_Solver solver, int row_scale)

*If row_scale not equal 0, values are scaled prior to factorization so that largest value in any row is +1 or -1.*

**HYPRE_EuclidSetILUT** (HYPRE_Solver solver, double drop_tol)

*Uses ILUT and defines a drop tolerance relative to the largest absolute value of any entry in the row being factored*

---

**MPI Parallel ILU preconditioner**

Options summary:

<table>
<thead>
<tr>

This page has been automatically generated with DOC++

DOC++ is ©1995 by Roland Wunderling

Malte Zöckler
6.4.1

int HYPRE_EuclidCreate (MPI_Comm comm, HYPRE_Solver* solver)

Create a Euclid object.

6.4.2

int HYPRE_EuclidDestroy (HYPRE_Solver solver)

Destroy a Euclid object.

6.4.3

int HYPRE_EuclidSetup (HYPRE_Solver solver, HYPRE_ParCSRMatrix A, HYPRE_ParVector b, HYPRE_ParVector x)

Set up the Euclid preconditioner. This function should be passed to the iterative solver SetPrecond function.

Parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>solver</td>
<td>[IN] Preconditioner object to set up.</td>
</tr>
<tr>
<td>A</td>
<td>[IN] ParCSR matrix used to construct the preconditioner.</td>
</tr>
<tr>
<td>b</td>
<td>Ignored by this function.</td>
</tr>
<tr>
<td>x</td>
<td>Ignored by this function.</td>
</tr>
</tbody>
</table>

6.4.4

int HYPRE_EuclidSolve (HYPRE_Solver solver, HYPRE_ParCSRMatrix A, HYPRE_ParVector b, HYPRE_ParVector x)

Apply the Euclid preconditioner. This function should be passed to the iterative solver SetPrecond function.
Parameters:  

- **solver**  [IN] Preconditioner object to apply.
- **A**  Ignored by this function.
- **b**  [IN] Vector to precondition.
- **x**  [OUT] Preconditioned vector.

---

6.4.5

```c
int HYPRE_EuclidSetParams (HYPRE_Solver solver, int argc, char* argv[])
```

Insert (name, value) pairs in Euclid’s options database by passing Euclid the command line (or an array of strings). All Euclid options (e.g., level, drop-tolerance) are stored in this database. If a (name, value) pair already exists, this call updates the value. See also: HYPRE_EuclidSetParamsFromFile.

Parameters:

- **argc**  [IN] Length of argv array
- **argv**  [IN] Array of strings

---

6.4.6

```c
int HYPRE_EuclidSetParamsFromFile (HYPRE_Solver solver, char* filename)
```

Insert (name, value) pairs in Euclid’s options database. Each line of the file should either begin with a “#,” indicating a comment line, or contain a (name value) pair, e.g:

```bash
cat optionsFile
#sample runtime parameter file
-blockJacobi 3
-matFile /home/hysom/myfile.euclid
-doSomething true
-xx_coeff -1.0
```

See also: HYPRE_EuclidSetParams.

Parameters:

- **filename**  [IN] Pathname/filename to read
6.4.7

```c
int HYPRE_EuclidSetLevel (HYPRE_Solver solver, int level)
```

Set level k for ILU(k) factorization, default: 1

6.4.8

```c
int HYPRE_EuclidSetBJ (HYPRE_Solver solver, int bj)
```

Use block Jacobi ILU preconditioning instead of PILU

6.4.9

```c
int HYPRE_EuclidSetStats (HYPRE_Solver solver, int eu_stats)
```

If eu_stats not equal 0, a summary of runtime settings and timing information is printed to stdout

6.4.10

```c
int HYPRE_EuclidSetMem (HYPRE_Solver solver, int eu_mem)
```

If eu_mem not equal 0, a summary of Euclid’s memory usage is printed to stdout

6.4.11

```c
int HYPRE_EuclidSetSparseA (HYPRE_Solver solver, double sparse_A)
```

Defines a drop tolerance for ILU(k). Default: 0 Use with HYPRE_EuclidSetRowScale. Note that this can destroy symmetry in a matrix.
6.4.12

```c
int HYPRE_EuclidSetRowScale (HYPRE_Solver solver, int row_scale)
```

If row_scale not equal 0, values are scaled prior to factorization so that largest value in any row is +1 or -1. Note that this can destroy symmetry in a matrix.

6.4.13

```c
int HYPRE_EuclidSetILUT (HYPRE_Solver solver, double drop_tol)
```

uses ILUT and defines a drop tolerance relative to the largest absolute value of any entry in the row being factored

6.5

ParCSR Pilut Preconditioner

Names

6.5.1

```c
int HYPRE_ParCSR PilutCreate (MPI_Comm comm, HYPRE_Solver* solver)
```

Create a preconditioner object ................................. 167

6.5.2

```c
int HYPRE_ParCSR PilutDestroy (HYPRE_Solver solver)
```

Destroy a preconditioner object ............................... 167

6.5.3

```c
int HYPRE_ParCSR PilutSetup (HYPRE_Solver solver,
                           HYPRE_ParCSRMatrix A,
                           HYPRE_ParVector b, HYPRE_ParVector x)
```

................................. 167

6.5.4

```c
int HYPRE_ParCSR PilutSolve (HYPRE_Solver solver,
                           HYPRE_ParCSRMatrix A,
                           HYPRE_ParVector b, HYPRE_ParVector x)
```

Precondition the system ................................. 167

6.5.5

```c
int HYPRE_ParCSR PilutSetMaxIter (HYPRE_Solver solver, int max_iter)
```

(Optional) Set maximum number of iterations ................................. 168

6.5.6

```c
int
```
6 ParCSR Solvers

**HYPRE_ParCSRPlutSetDropTolerance** (HYPRE_Solver solver, double tol)  
(***Optional***)  

6.5.7  int  
**HYPRE_ParCSRPlutSetFactorRowSize** (HYPRE_Solver solver, int size)  
(***Optional***)  

6.5.1  

int **HYPRE_ParCSRPlutCreate** (MPI_Comm comm, HYPRE_Solver* solver)  
Create a preconditioner object  

6.5.2  

int **HYPRE_ParCSRPlutDestroy** (HYPRE_Solver solver)  
Destroy a preconditioner object  

6.5.3  

int  
**HYPRE_ParCSRPlutSetup** (HYPRE_Solver solver, HYPRE_ParCSRMatrix A,  
HYPRE_ParVector b, HYPRE_ParVector x)  

6.5.4  

int  
**HYPRE_ParCSRPlutSolve** (HYPRE_Solver solver, HYPRE_ParCSRMatrix A,  
HYPRE_ParVector b, HYPRE_ParVector x)  
Precondition the system
6.5.5

int HYPRE_ParCSRilutSetMaxIter (HYPRE_Solver solver, int max_iter)

(Optional) Set maximum number of iterations

6.5.6

int HYPRE_ParCSRilutSetDropTolerance (HYPRE_Solver solver, double tol)

(Optional)

6.5.7

int HYPRE_ParCSRilutSetFactorRowSize (HYPRE_Solver solver, int size)

(Optional)

6.6

ParCSR AMS Solver and Preconditioner

Names

6.6.1 int

HYPRE_AMSCreate (HYPRE_Solver* solver)

Create an AMS solver object ................................. 171

6.6.2 int

HYPRE_AMSDestroy (HYPRE_Solver solver)

Destroy an AMS solver object ............................... 171

6.6.3 int

HYPRE_AMSSetup (HYPRE_Solver solver, HYPRE_ParCSRMatrix A,
HYPRE_ParVector b, HYPRE_ParVector x)

Set up the AMS solver or preconditioner. .................... 171

6.6.4 int

This page has been automatically generated with DOC++

DOC++ is ©1995 by Roland Wunderling
Malte Zöckler

168
HYPRE_AMSSolve (HYPRE_Solver solver, HYPRE_ParCSRMatrix A, 
HYPRE_ParVector b, HYPRE_ParVector x) 
Solve the system or apply AMS as a preconditioner. .................. 172

6.6.5 int 
HYPRE_AMSSetDimension (HYPRE_Solver solver, int dim) 
(Optional) Sets the problem dimension (2 or 3). ...................... 172

6.6.6 int 
HYPRE_AMSSetDiscreteGradient (HYPRE_Solver solver, 
HYPRE_ParCSRMatrix G) 
Sets the discrete gradient matrix G. ................................. 172

6.6.7 int 
HYPRE_AMSSetCoordinateVectors (HYPRE_Solver solver, 
HYPRE_ParVector x, 
HYPRE_ParVector y, 
HYPRE_ParVector z) 
Sets the x, y and z coordinates of the vertices in the mesh. ............ 173

6.6.8 int 
HYPRE_AMSSetEdgeConstantVectors (HYPRE_Solver solver, 
HYPRE_ParVector Gx, 
HYPRE_ParVector Gy, 
HYPRE_ParVector Gz) 
Sets the vectors Gx, Gy and Gz which give the representations of the constant vector fields (1, 0, 0), (0, 1, 0) and (0, 0, 1) in the edge element basis. ............................ 173

6.6.9 int 
HYPRE_AMSSetInterpolations (HYPRE_Solver solver, 
HYPRE_ParCSRMatrix Pi, 
HYPRE_ParCSRMatrix Pix, 
HYPRE_ParCSRMatrix Piy, 
HYPRE_ParCSRMatrix Piz) 
(Optional) Set the (components of) the Nedelec interpolation matrix \( \Pi = [\Pi^x, \Pi^y, \Pi^z] \). ..................................................... 173

6.6.10 int 
HYPRE_AMSSetAlphaPoissonMatrix (HYPRE_Solver solver, 
HYPRE_ParCSRMatrix A_alpha) 
(Optional) Sets the matrix \( A_\alpha \) corresponding to the Poisson problem with coefficient \( \alpha \) (the curl-curl term coefficient in the Maxwell problem). ...... 174

6.6.11 int 
HYPRE_AMSSetBetaPoissonMatrix (HYPRE_Solver solver, 
HYPRE_ParCSRMatrix A_beta) 
(Optional) Sets the matrix \( A_\beta \) corresponding to the Poisson problem with coefficient \( \beta \) (the mass term coefficient in the Maxwell problem). ....... 174

6.6.12 int 
HYPRE_AMSSetInteriorNodes (HYPRE_Solver solver, 
HYPRE_ParVector interior_nodes) 
(Optional) Set the list of nodes which are interior to a zero-conductivity region. ................................................................. 174

6.6.13 int
**HYPRE_AMSSetProjectionFrequency** (HYPRE_Solver solver, int projection_frequency)

(Optional) Set the frequency at which a projection onto the compatible subspace for problems with zero-conductivity regions is performed.  

6.6.14 int **HYPRE_AMSSetMaxIter** (HYPRE_Solver solver, int maxit)

(Optional) Sets maximum number of iterations, if AMS is used as a solver.  

6.6.15 int **HYPRE_AMSSetTol** (HYPRE_Solver solver, double tol)

(Optional) Set the convergence tolerance, if AMS is used as a solver.  

6.6.16 int **HYPRE_AMSSetCycleType** (HYPRE_Solver solver, int cycle_type)

(Optional) Choose which three-level solver to use.  

6.6.17 int **HYPRE_AMSSetPrintLevel** (HYPRE_Solver solver, int print_level)

(Optional) Control how much information is printed during the solution iterations.  

6.6.18 int **HYPRE_AMSSetSmoothingOptions** (HYPRE_Solver solver, int relax_type, int relax_times, double relax_weight, double omega)

(Optional) Sets relaxation parameters for A.  

6.6.19 int **HYPRE_AMSSetAlphaAMGOptions** (HYPRE_Solver solver, int alpha_coarsen_type, int alpha_agg_levels, int alpha_relax_type, double alpha_strength_threshold, int alpha_interp_type, int alpha_Pmax)

(Optional) Sets AMG parameters for \(B_{\Pi}\).  

6.6.20 int **HYPRE_AMSSetBetaAMGOptions** (HYPRE_Solver solver, int beta_coarsen_type, int beta_agg_levels, int beta_relax_type, double beta_strength_threshold, int beta_interp_type, int beta_Pmax)

(Optional) Sets AMG parameters for \(B_G\).  

6.6.21 int **HYPRE_AMSGetNumIterations** (HYPRE_Solver solver, int* num_iterations)

Returns the number of iterations taken  

6.6.22 int **HYPRE_AMSGetFinalRelativeResidualNorm** (HYPRE_Solver solver, double* rel_resid_norm)

Returns the norm of the final relative residual  

6.6.23 int
**HYPRE_AMSProjectOutGradients** (HYPRE_Solver solver,  
HYPRE_ParVector x)

For problems with zero-conductivity regions, project the vector onto the  
compatible subspace:  
\[ x = (I - G_0(G_0^T G_0)^{-1} G_0^T)x, \]  
where  
\(G_0\)  
is the discrete  
gradien1  
restric1  
t to the interior nodes of the regions with zero conductivity. 

---

**6.6.24** int  
**HYPRE_AMSConstructDiscreteGradient** (HYPRE_ParCSRMatrix A,  
HYPRE_ParVector x_coord,  
int* edge_vertex,  
int edge_orientation,  
HYPRE_ParCSRMatrix* G)

Construct and return the lowest-order discrete gradient matrix  
\(G\) using some  
edge and vertex information. 

---

Parallel auxiliary space Maxwell solver and preconditioner

---

**6.6.1** int  
**HYPRE_AMSCreate** (HYPRE_Solver* solver)

Create an AMS solver object

---

**6.6.2** int  
**HYPRE_AMSDestroy** (HYPRE_Solver solver)

Destroy an AMS solver object

---

**6.6.3** int  
**HYPRE_AMSSetup** (HYPRE_Solver solver, HYPRE_ParCSRMatrix A,  
HYPRE_ParVector b, HYPRE_ParVector x)

Set up the AMS solver or preconditioner. If used as a preconditioner, this function should be passed to the  
iterative solver  
**SetPrecond** function.
Parameters:  

- `solver` [IN] object to be set up.
- `A` [IN] ParCSR matrix used to construct the solver/preconditioner.
- `b` Ignored by this function.
- `x` Ignored by this function.

---

### 6.6.4

```c
int HYPRE_AMSSolve (HYPRE_Solver solver, HYPRE_ParCSRMatrix A, HYPRE_ParVector b, HYPRE_ParVector x)
```

Solve the system or apply AMS as a preconditioner. If used as a preconditioner, this function should be passed to the iterative solver `SetPrecond` function.

Parameters:  

- `solver` [IN] solver or preconditioner object to be applied.
- `A` [IN] ParCSR matrix, matrix of the linear system to be solved.
- `b` [IN] right hand side of the linear system to be solved.
- `x` [OUT] approximated solution of the linear system to be solved.

---

### 6.6.5

```c
int HYPRE_AMSSetDimension (HYPRE_Solver solver, int dim)
```

(Optional) Sets the problem dimension (2 or 3). The default is 3.

---

### 6.6.6

```c
int HYPRE_AMSSetDiscreteGradient (HYPRE_Solver solver, HYPRE_ParCSRMatrix G)
```

Sets the discrete gradient matrix `G`. This function should be called before `HYPRE_AMSSetup()`!
6.6.7

```c
int HYPRE_AMSSetCoordinateVectors (HYPRE_Solver solver,
                                      HYPRE_ParVector x, HYPRE_ParVector y, HYPRE_ParVector z)
```

Sets the $x$, $y$ and $z$ coordinates of the vertices in the mesh.

Either HYPRE_AMSSetCoordinateVectors() or HYPRE_AMSSetEdgeConstantVectors() should be called before HYPRE_AMSSetup()!

6.6.8

```c
int HYPRE_AMSSetEdgeConstantVectors (HYPRE_Solver solver,
                                      HYPRE_ParVector Gx, HYPRE_ParVector Gy, HYPRE_ParVector Gz)
```

Sets the vectors $Gx$, $Gy$ and $Gz$ which give the representations of the constant vector fields $(1, 0, 0)$, $(0, 1, 0)$ and $(0, 0, 1)$ in the edge element basis.

Either HYPRE_AMSSetCoordinateVectors() or HYPRE_AMSSetEdgeConstantVectors() should be called before HYPRE_AMSSetup()!

6.6.9

```c
int HYPRE_AMSSetInterpolations (HYPRE_Solver solver,
                                      HYPRE_ParCSRMatrix Pi, HYPRE_ParCSRMatrix Pix, HYPRE_ParCSRMatrix Piy, HYPRE_ParCSRMatrix Piz)
```

(Optional) Set the (components of) the Nedelec interpolation matrix \( \Pi = [\Pi^x, \Pi^y, \Pi^z] \).

This function is generally intended to be used only for high-order Nedelec discretizations (in the lowest order case, \( \Pi \) is constructed internally in AMS from the discreet gradient matrix and the coordinates of the vertices), though it can also be used in the lowest-order case or for other types of discretizations (e.g. ones based on the second family of Nedelec elements).

By definition, \( \Pi \) is the matrix representation of the linear operator that interpolates (high-order) vector nodal finite elements into the (high-order) Nedelec space. The component matrices are defined as \( \Pi^x \varphi = \Pi(\varphi, 0, 0) \) and similarly for \( \Pi^y \) and \( \Pi^z \). Note that all these operators depend on the choice of the basis and degrees of freedom in the high-order spaces.
The column numbering of \( \Pi \) should be node-based, i.e. the \( x/y/z \) components of the first node (vertex or high-order dof) should be listed first, followed by the \( x/y/z \) components of the second node and so on (see the documentation of \texttt{HYPRE\_BoomerAMGSetDofFunc}).

If used, this function should be called before \texttt{HYPRE\_AMSSetup()} and there is no need to provide the vertex coordinates. Furthermore, only one of the sets \( \{ \Pi \} \) and \( \{ \Pi^x, \Pi^y, \Pi^z \} \) needs to be specified (though it is OK to provide both). If \( \Pi^x \) is NULL, then scalar \( \Pi \)-based AMS cycles, i.e. those with cycle_type > 10, will be unavailable. Similarly, AMS cycles based on monolithic \( \Pi \) (cycle_type < 10) require that \( \Pi \) is not NULL.

\section{6.6.10}

\begin{verbatim}
int HYPRE_AMSSetAlphaPoissonMatrix (HYPRE_Solver solver, 
HYPRE_ParCSRMatrix A_alpha)
\end{verbatim}

(Optional) Sets the matrix \( A_\alpha \) corresponding to the Poisson problem with coefficient \( \alpha \) (the curl-curl term coefficient in the Maxwell problem).

If this function is called, the coarse space solver on the range of \( \Pi^T \) is a block-diagonal version of \( A_\Pi \). If this function is not called, the coarse space solver on the range of \( \Pi^T \) is constructed as \( \Pi^T A_\Pi \Pi \) in \texttt{HYPRE\_AMSSetup()}. See the user’s manual for more details.

\section{6.6.11}

\begin{verbatim}
int HYPRE_AMSSetBetaPoissonMatrix (HYPRE_Solver solver, 
HYPRE_ParCSRMatrix A_beta)
\end{verbatim}

(Optional) Sets the matrix \( A_\beta \) corresponding to the Poisson problem with coefficient \( \beta \) (the mass term coefficient in the Maxwell problem).

If not given, the Poisson matrix will be computed in \texttt{HYPRE\_AMSSetup()}. If the given matrix is NULL, we assume that \( \beta \) is identically 0 and use two-level (instead of three-level) methods. See the user’s manual for more details.

\section{6.6.12}

\begin{verbatim}
int HYPRE_AMSSetInteriorNodes (HYPRE_Solver solver, HYPRE_ParVector 
interior_nodes)
\end{verbatim}
(Optional) Set the list of nodes which are interior to a zero-conductivity region. This way, a more robust solver is constructed, that can be iterated to lower tolerance levels. This function should be called before HYPRE_AMSSetup()!

----

6.6.13

```c
int HYPRE_AMSSetProjectionFrequency (HYPRE_Solver solver, int projection_frequency)
```

(Optional) Set the frequency at which a projection onto the compatible subspace for problems with zero-conductivity regions is performed. The default value is 5.

----

6.6.14

```c
int HYPRE_AMSSetMaxIter (HYPRE_Solver solver, int maxit)
```

(Optional) Sets maximum number of iterations, if AMS is used as a solver. To use AMS as a preconditioner, set the maximum number of iterations to 1. The default is 20.

----

6.6.15

```c
int HYPRE_AMSSetTol (HYPRE_Solver solver, double tol)
```

(Optional) Set the convergence tolerance, if AMS is used as a solver. When using AMS as a preconditioner, set the tolerance to 0.0. The default is $10^{-6}$.

----

6.6.16

```c
int HYPRE_AMSSetCycleType (HYPRE_Solver solver, int cycle_type)
```

(Optional) Choose which three-level solver to use. Possible values are:
<table>
<thead>
<tr>
<th></th>
<th>3-level multiplicative solver (01210)</th>
<th>3-level additive solver (0+1+2)</th>
<th>3-level multiplicative solver (02120)</th>
<th>3-level additive solver (010+2)</th>
<th>3-level multiplicative solver (0102010)</th>
<th>3-level additive solver (1+020)</th>
<th>3-level multiplicative solver (0201020)</th>
<th>3-level additive solver (0(1+2)0)</th>
<th>3-level multiplicative solver (013454310)</th>
<th>5-level additive solver (0+1+3+4+5)</th>
<th>5-level multiplicative solver (034515430)</th>
<th>5-level additive solver (01(3+4+5)10)</th>
</tr>
</thead>
</table>

The default is 1. See the user’s manual for more details.

**6.6.17**

```c
int HYPRE_AMSSetPrintLevel (HYPRE_Solver solver, int print_level)
```

(Optional) Control how much information is printed during the solution iterations. The default is 1 (print residual norm at each step).

**6.6.18**

```c
int HYPRE_AMSSetSmoothingOptions (HYPRE_Solver solver, int relax_type, int relax_times, double relax_weight, double omega)
```

(Optional) Sets relaxation parameters for $A$. The defaults are 2, 1, 1.0, 1.0.

The available options for `relax_type` are:

<table>
<thead>
<tr>
<th></th>
<th>\ell_1\text{-scaled Jacobi}</th>
<th>\ell_1\text{-scaled block symmetric Gauss-Seidel/SSOR}</th>
<th>Kaczmarz</th>
<th>truncated version of \ell_1\text{-scaled block symmetric Gauss-Seidel/SSOR}</th>
<th>Chebyshev</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>\ell_1\text{-scaled Jacobi}</td>
<td>\ell_1\text{-scaled block symmetric Gauss-Seidel/SSOR}</td>
<td>Kaczmarz</td>
<td>truncated version of \ell_1\text{-scaled block symmetric Gauss-Seidel/SSOR}</td>
<td>Chebyshev</td>
</tr>
</tbody>
</table>
6.6.19

```c
int
HYPRE_AMSSetAlphaAMGOptions (HYPRE_Solver solver, int
alpha_coarsen_type, int alpha_agg_levels, int alpha_relax_type, double
alpha_strength_threshold, int alpha_interp_type, int alpha_Pmax)
```

(Optional) Sets AMG parameters for $B_H$. The defaults are 10, 1, 3, 0.25, 0, 0. See the user’s manual for more details.

6.6.20

```c
int
HYPRE_AMSSetBetaAMGOptions (HYPRE_Solver solver, int
beta_coarsen_type, int beta_agg_levels, int beta_relax_type, double
beta_strength_threshold, int beta_interp_type, int beta_Pmax)
```

(Optional) Sets AMG parameters for $B_G$. The defaults are 10, 1, 3, 0.25, 0, 0. See the user’s manual for more details.

6.6.21

```c
int
HYPRE_AMSSGetNumIterations (HYPRE_Solver solver, int* num_iterations)
```

Returns the number of iterations taken

6.6.22

```c
int
HYPRE_AMSSGetFinalRelativeResidualNorm (HYPRE_Solver solver,
double* rel_resid_norm)
```

Returns the norm of the final relative residual
For problems with zero-conductivity regions, project the vector onto the compatible subspace: 

\[ x = (I - G_0(G_0^{-1}G_0^T))x, \]

where \( G_0 \) is the discrete gradient restricted to the interior nodes of the regions with zero conductivity. This ensures that \( x \) is orthogonal to the gradients in the range of \( G_0 \).

This function is typically called after the solution iteration is complete, in order to facilitate the visualization of the computed field. Without it the values in the zero-conductivity regions contain kernel components.

Construct and return the lowest-order discrete gradient matrix \( G \) using some edge and vertex information. We assume that edge_vertex lists the edge vertices consecutively, and that the orientation of all edges is consistent.

If edge_orientation = 1, the edges are already oriented.

If edge_orientation = 2, the orientation of edge \( i \) depends only on the sign of edge_vertex\[2*i+1\] - edge_vertex\[2*i\].

**ParCSR ADS Solver and Preconditioner**

**Names**

6.7.1 int 
**HYPRE_ADSCreate** (HYPRE_Solver* solver)  
Create an ADS solver object  

6.7.2 int 
**HYPRE_ADSDestroy** (HYPRE_Solver solver)  
Destroy an ADS solver object  

6.7.3 int
6.7.4  
**HYPRE_ADSSetup** (HYPRE_Solver solver, HYPRE_ParCSRMatrix A,  
HYPRE_ParVector b, HYPRE_ParVector x)

*Set up the ADS solver or preconditioner.* ................................. [181]

6.7.5  
**HYPRE_ADSSolve** (HYPRE_Solver solver, HYPRE_ParCSRMatrix A,  
HYPRE_ParVector b, HYPRE_ParVector x)

*Solve the system or apply ADS as a preconditioner.* ........................ [181]

6.7.6  
**HYPRE_ADSSetDiscreteCurl** (HYPRE_Solver solver,  
HYPRE_ParCSRMatrix C)

*Sets the discrete curl matrix C.* ............................................. [181]

6.7.7  
**HYPRE_ADSSetDiscreteGradient** (HYPRE_Solver solver,  
HYPRE_ParCSRMatrix G)

*Sets the discrete gradient matrix G.* ....................................... [182]

6.7.8  
**HYPRE_ADSSetCoordinateVectors** (HYPRE_Solver solver,  
HYPRE_ParVector x,  
HYPRE_ParVector y,  
HYPRE_ParVector z)

*Sets the x, y and z coordinates of the vertices in the mesh.* ............. [182]

6.7.9  
**HYPRE_ADSSetInterpolations** (HYPRE_Solver solver,  
HYPRE_ParCSRMatrix RT_Pi,  
HYPRE_ParCSRMatrix RT_Pix,  
HYPRE_ParCSRMatrix RT_Piy,  
HYPRE_ParCSRMatrix RT_Piz,  
HYPRE_ParCSRMatrix ND_Pi,  
HYPRE_ParCSRMatrix ND_Pix,  
HYPRE_ParCSRMatrix ND_Piy,  
HYPRE_ParCSRMatrix ND_Piz)

*(Optional) Set the (components of) the Raviart-Thomas (\(\Pi_{RT}\)) and the Nedelec (\(\Pi_{ND}\)) interpolation matrices.* ............................................. [182]

6.7.10  
**HYPRE_ADSSetMaxIter** (HYPRE_Solver solver, int maxit)

*(Optional) Sets AMS parameters for \( B_C \).*  

**6.7.16** int HYPRE_ADSSetAMGOptions (HYPRE_Solver solver, int coarsen_type, int agg_levels, int relax_type, double strength_threshold, int interp_type, int Pmax)  
*(Optional) Sets AMG parameters for \( B_\Pi \).*  

**6.7.17** int HYPRE_ADSSGetNumIterations (HYPRE_Solver solver, int* num_iterations)  
*Returns the number of iterations taken*  

**6.7.18** int HYPRE_ADSSGetFinalRelativeResidualNorm (HYPRE_Solver solver, double* rel_resid_norm)  
*Returns the norm of the final relative residual*  

### Parallel auxiliary space divergence solver and preconditioner

**6.7.1** int HYPRE_ADSCreate (HYPRE_Solver* solver)  
Create an ADS solver object  

**6.7.2** int HYPRE_ADSDestroy (HYPRE_Solver solver)
Destroy an ADS solver object

### 6.7.3

```c
int HYPRE_ADSSetup (HYPRE_Solver solver, HYPRE_ParCSRMatrix A, HYPRE_ParVector b, HYPRE_ParVector x)
```

Set up the ADS solver or preconditioner. If used as a preconditioner, this function should be passed to the iterative solver `SetPrecond` function.

**Parameters:**
- `solver` [IN] object to be set up.
- `A` [IN] ParCSR matrix used to construct the solver/preconditioner.
- `b` Ignored by this function.
- `x` Ignored by this function.

### 6.7.4

```c
int HYPRE_ADSSolve (HYPRE_Solver solver, HYPRE_ParCSRMatrix A, HYPRE_ParVector b, HYPRE_ParVector x)
```

Solve the system or apply ADS as a preconditioner. If used as a preconditioner, this function should be passed to the iterative solver `SetPrecond` function.

**Parameters:**
- `solver` [IN] solver or preconditioner object to be applied.
- `A` [IN] ParCSR matrix, matrix of the linear system to be solved
- `b` [IN] right hand side of the linear system to be solved
- `x` [OUT] approximated solution of the linear system to be solved

### 6.7.5

```c
int HYPRE_ADSSetDiscreteCurl (HYPRE_Solver solver, HYPRE_ParCSRMatrix C)
```
Sets the discrete curl matrix \( C \). This function should be called before HYPRE_ADSSetup()!

### 6.7.6

```c
int HYPRE_ADSSetDiscreteGradient (HYPRE_Solver solver, HYPRE_ParCSRMatrix G)
```

Sets the discrete gradient matrix \( G \). This function should be called before HYPRE_ADSSetup()!

### 6.7.7

```c
int HYPRE_ADSSetCoordinateVectors (HYPRE_Solver solver, HYPRE_ParVector x, HYPRE_ParVector y, HYPRE_ParVector z)
```

Sets the \( x \), \( y \) and \( z \) coordinates of the vertices in the mesh. This function should be called before HYPRE_ADSSetup()!

### 6.7.8

```c
int HYPRE_ADSSetInterpolations (HYPRE_Solver solver, HYPRE_ParCSRMatrix RT_Pi, HYPRE_ParCSRMatrix RT_Pix, HYPRE_ParCSRMatrix RT_Piy, HYPRE_ParCSRMatrix RT_Piz, HYPRE_ParCSRMatrix ND_Pi, HYPRE_ParCSRMatrix ND_Pix, HYPRE_ParCSRMatrix ND_Piy, HYPRE_ParCSRMatrix ND_Piz)
```

(Optional) Set the (components of) the Raviart-Thomas (\( \Pi_{RT} \)) and the Nedelec (\( \Pi_{ND} \)) interpolation matrices.

This function is generally intended to be used only for high-order \( H(div) \) discretizations (in the lowest order case, these matrices are constructed internally in ADS from the discrete gradient and curl matrices and the coordinates of the vertices), though it can also be used in the lowest-order case or for other types of discretizations.

By definition, \( RT_Pi \) and \( ND_Pi \) are the matrix representations of the linear operators \( \Pi_{RT} \) and \( \Pi_{ND} \) that interpolate (high-order) vector nodal finite elements into the (high-order) Raviart-Thomas and Nedelec
spaces. The component matrices are defined in both cases as $\Pi^x\varphi = \Pi(\varphi, 0, 0)$ and similarly for $\Pi^y$ and $\Pi^z$.

Note that all these operators depend on the choice of the basis and degrees of freedom in the high-order spaces.

The column numbering of RT_Pi and ND_Pi should be node-based, i.e. the $x/y/z$ components of the first node (vertex or high-order dof) should be listed first, followed by the $x/y/z$ components of the second node and so on (see the documentation of HYPRE_BoomerAMGSetDofFunc).

If used, this function should be called before hypre_ADSSetup() and there is no need to provide the vertex coordinates. Furthermore, only one of the sets $\{\Pi_{RT}\}$ and $\{\Pi_{RT}^x, \Pi_{RT}^y, \Pi_{RT}^z\}$ needs to be specified (though it is OK to provide both). If RT_Pix is NULL, then scalar $\Pi$-based ADS cycles, i.e. those with cycle_type > 10, will be unavailable. Similarly, ADS cycles based on monolithic $\Pi$ (cycle_type < 10) require that RT_Pi is not NULL. The same restrictions hold for the sets $\{\Pi_{ND}\}$ and $\{\Pi_{ND}^x, \Pi_{ND}^y, \Pi_{ND}^z\}$ – only one of them needs to be specified, and the availability of each enables different AMS cycle type options.

---

### 6.7.9

```
int HYPRE_ADSSetMaxIter (HYPRE_Solver solver, int maxit)
```

(Optional) Sets maximum number of iterations, if ADS is used as a solver. To use ADS as a preconditioner, set the maximum number of iterations to 1. The default is 20.

### 6.7.10

```
int HYPRE_ADSSetTol (HYPRE_Solver solver, double tol)
```

(Optional) Set the convergence tolerance, if ADS is used as a solver. When using ADS as a preconditioner, set the tolerance to 0.0. The default is $10^{-6}$.

### 6.7.11

```
int HYPRE_ADSSetCycleType (HYPRE_Solver solver, int cycle_type)
```

(Optional) Choose which auxiliary-space solver to use. Possible values are:
The default is 1. See the user’s manual for more details.

6.7.12

```c
int HYPRE_ADSSetPrintLevel (HYPRE_Solver solver, int print_level)
```

(Optional) Control how much information is printed during the solution iterations. The default is 1 (print residual norm at each step).

6.7.13

```c
int HYPRE_ADSSetSmoothingOptions (HYPRE_Solver solver, int relax_type, int relax_times, double relax_weight, double omega)
```

(Optional) Sets relaxation parameters for $A$. The defaults are 2, 1, 1.0, 1.0.

The available options for `relax_type` are:

1. $\ell_1$-scaled Jacobi
2. $\ell_1$-scaled block symmetric Gauss-Seidel/SSOR
3. Kaczmarz
4. truncated version of $\ell_1$-scaled block symmetric Gauss-Seidel/SSOR
16. Chebyshev
6.7.14

int

HYPRE_ADSSetChebySmoothingOptions (HYPRE_Solver solver, int cheby_order, int cheby_fraction)

(Optional) Sets parameters for Chebyshev relaxation. The defaults are 2, 0.3.

6.7.15

int

HYPRE_ADSSetAMSOptions (HYPRE_Solver solver, int cycle_type, int coarsen_type, int agg_levels, int relax_type, double strength_threshold, int interp_type, int Pmax)

(Optional) Sets AMS parameters for $B_C$. The defaults are 11, 10, 1, 3, 0.25, 0, 0. Note that cycle_type should be greater than 10, unless the high-order interface of HYPRE_ADSSetInterpolations is being used! See the user’s manual for more details.

6.7.16

int

HYPRE_ADSSetAMGOptions (HYPRE_Solver solver, int coarsen_type, int agg_levels, int relax_type, double strength_threshold, int interp_type, int Pmax)

(Optional) Sets AMG parameters for $B_H$. The defaults are 10, 1, 3, 0.25, 0, 0. See the user’s manual for more details.

6.7.17

int

HYPRE_ADSSGetNumIterations (HYPRE_Solver solver, int* num_iterations)

Returns the number of iterations taken.
6.7.18

```c
int HYPRE_ADSGetFinalRelativeResidualNorm (HYPRE_Solver solver, double* rel_resid_norm)
```

Returns the norm of the final relative residual.

6.8

ParCSR PCG Solver

Names

6.8.1 int `HYPRE_ParCSRPCGCreate` (MPI_Comm comm, HYPRE_Solver* solver)  
Create a solver object  

6.8.2 int `HYPRE_ParCSRPCGDestroy` (HYPRE_Solver solver)  
Destroy a solver object  

6.8.3 int `HYPRE_ParCSRDiagScaleSetup` (HYPRE_Solver solver,  
HYPRE_ParCSRMatrix A,  
HYPRE_ParVector y,  
HYPRE_ParVector x)  
Setup routine for diagonal preconditioning  

6.8.4 int `HYPRE_ParCSRDiagScale` (HYPRE_Solver solver,  
HYPRE_ParCSRMatrix HA,  
HYPRE_ParVector Hy, HYPRE_ParVector Hx)  
Solve routine for diagonal preconditioning  

These routines should be used in conjunction with the generic interface in PCG Solver.

6.8.1

```c
int HYPRE_ParCSRPCGCreate (MPI_Comm comm, HYPRE_Solver* solver)
```

Create a solver object.
6.8.2

int HYPRE_ParCSRPCGDestroy (HYPRE_Solver solver)

Destroy a solver object

6.8.3

int HYPRE_ParCSRDiagScaleSetup (HYPRE_Solver solver,
HYPRE_ParCSRMatrix A, HYPRE_ParVector y, HYPRE_ParVector x)

Setup routine for diagonal preconditioning

6.8.4

int HYPRE_ParCSRDiagScale (HYPRE_Solver solver, HYPRE_ParCSRMatrix HA,
HYPRE_ParVector Hy, HYPRE_ParVector Hx)

Solve routine for diagonal preconditioning

6.9

ParCSR GMRES Solver

Names

6.9.1 int HYPRE_ParCSRGMRESCreate (MPI_Comm comm,
HYPRE_Solver* solver)

Create a solver object .................................................... 188

6.9.2 int HYPRE_ParCSRGMRESDestroy (HYPRE_Solver solver)

Destroy a solver object ..................................................... 188

These routines should be used in conjunction with the generic interface in GMRES Solver.
6.9.1

```c
int HYPRE_ParCSRGMRESCreate (MPI_Comm comm, HYPRE_Solver* solver)
```

Create a solver object

6.9.2

```c
int HYPRE_ParCSRGMRESDestroy (HYPRE_Solver solver)
```

Destroy a solver object

6.10

ParCSR FlexGMRES Solver

Names

6.10.1

```c
int HYPRE_ParCSRFlexGMRESCreate (MPI_Comm comm,
        HYPRE_Solver* solver)
```

Create a solver object

6.10.2

```c
int HYPRE_ParCSRFlexGMRESDestroy (HYPRE_Solver solver)
```

Destroy a solver object

These routines should be used in conjunction with the generic interface in FlexGMRES Solver.

6.10.1

```c
int HYPRE_ParCSRFlexGMRESCreate (MPI_Comm comm, HYPRE_Solver* solver)
```

Create a solver object
6.10.2

```c
int HYPRE_ParCSRFlexGMRESDestroy (HYPRE_Solver solver)
```

Destroy a solver object

6.11

ParCSR LGMRES Solver

Names

6.11.1

```c
int HYPRE_ParCSRLGMRESCreate (MPI_Comm comm,
                                HYPRE_Solver* solver)
```

Create a solver object

6.11.2

```c
int HYPRE_ParCSRLGMRESDestroy (HYPRE_Solver solver)
```

Destroy a solver object

These routines should be used in conjunction with the generic interface in LGMRES Solver.
ParCSR BiCGSTAB Solver

Names

6.12.1 int \texttt{HYPRE\_ParCSRBiCGSTABCreate} (MPI\_Comm \texttt{comm},
\texttt{HYPRE\_Solver* \texttt{solver}})

Create a solver object

6.12.2 int \texttt{HYPRE\_ParCSRBiCGSTABDestroy} (\texttt{HYPRE\_Solver \texttt{solver}})

Destroy a solver object

These routines should be used in conjunction with the generic interface in BiCGSTAB Solver.

ParCSR Hybrid Solver

Names

6.13.1 int

**HYPER_ParCSRHybridCreate** (HYPRE_Solver* solver)

*Create solver object* ......................................................... 195

6.13.2 int

**HYPER_ParCSRHybridDestroy** (HYPRE_Solver solver)

*Destroy solver object* .......................................................... 195

6.13.3 int

**HYPER_ParCSRHybridSetup** (HYPRE_Solver solver,
HYPRE_ParCSRMatrix A,
HYPRE_ParVector b, HYPRE_ParVector x)

*Setup the hybrid solver* ......................................................... 195

6.13.4 int

**HYPER_ParCSRHybridSolve** (HYPRE_Solver solver,
HYPRE_ParCSRMatrix A,
HYPRE_ParVector b, HYPRE_ParVector x)

*Solve linear system* .............................................................. 195

6.13.5 int

**HYPER_ParCSRHybridSetTol** (HYPRE_Solver solver, double tol)

*Set the convergence tolerance for the Krylov solver.* ............... 196

6.13.6 int

**HYPER_ParCSRHybridSetAbsoluteTol** (HYPRE_Solver solver, double tol)

*Set the absolute convergence tolerance for the Krylov solver.* .... 196

6.13.7 int

**HYPER_ParCSRHybridSetConvergenceTol** (HYPRE_Solver solver,
double cf_tol)

*Set the desired convergence factor* ........................................ 196

6.13.8 int

**HYPER_ParCSRHybridSetDSCGMaxIter** (HYPRE_Solver solver,
int dscg_max_its)

*Set the maximal number of iterations for the diagonally preconditioned solver* .......................................................... 196

6.13.9 int

**HYPER_ParCSRHybridSetPCGMaxIter** (HYPRE_Solver solver,
int pcg_max_its)

*Set the maximal number of iterations for the AMG preconditioned solver* .......................................................... 197

6.13.10 int

**HYPER_ParCSRHybridSetSolverType** (HYPRE_Solver solver,
int solver_type)

*Set the desired solver type.* ................................................ 197

6.13.11 int

**HYPER_ParCSRHybridSetKDim** (HYPRE_Solver solver, int k_dim)

*Set the Krylov dimension for restarted GMRES.* ....................... 197

6.13.12 int

**HYPER_ParCSRHybridSetTwoNorm** (HYPRE_Solver solver, int two_norm)

*Set the type of norm for PCG* ................................................. 197

6.13.13 int

DOC++ is ©1995 by Roland Wunderling
Malte Zöckler
6.13.14 int HYPRE_ParCSRHybridSetLogging (HYPRE_Solver solver, int logging)

   Set logging parameter (default: 0, no logging) ..............................

6.13.15 int HYPRE_ParCSRHybridSetPrintLevel (HYPRE_Solver solver, int print_level)

   Set print level (default: 0, no printing) ....................................

6.13.16 int HYPRE_ParCSRHybridSetStrongThreshold (HYPRE_Solver solver, double strong_threshold)

   (Optional) Sets AMG strength threshold. .....................................

6.13.17 int HYPRE_ParCSRHybridSetMaxRowSum (HYPRE_Solver solver, double max_row_sum)

   (Optional) Sets a parameter to modify the definition of strength for diagonal dominant portions of the matrix. ..............................

6.13.18 int HYPRE_ParCSRHybridSetTruncFactor (HYPRE_Solver solver, double trunc_factor)

   (Optional) Defines a truncation factor for the interpolation. ..........

6.13.19 int HYPRE_ParCSRHybridSetPMaxElmts (HYPRE_Solver solver, int P_max_elmts)

   (Optional) Defines the maximal number of elements per row for the interpolation. ..........................................................

6.13.20 int HYPRE_ParCSRHybridSetMaxLevels (HYPRE_Solver solver, int max_levels)

   (Optional) Defines the maximal number of levels used for AMG. .......

6.13.21 int HYPRE_ParCSRHybridSetMeasureType (HYPRE_Solver solver, int measure_type)

   (Optional) Defines whether local or global measures are used ..........

6.13.22 int HYPRE_ParCSRHybridSetCoarsenType (HYPRE_Solver solver, int coarsen_type)

   (Optional) Defines which parallel coarsening algorithm is used. ........

6.13.23 int HYPRE_ParCSRHybridSetCycleType (HYPRE_Solver solver, int cycle_type)

   (Optional) Defines the type of cycle. ...........................................
**HYPRE_ParCSRHybridSetNumSweeps** (HYPRE_Solver solver, int num_sweeps)

*(Optional) Sets the number of sweeps.*

6.13.25

**HYPRE_ParCSRHybridSetCycleNumSweeps** (HYPRE_Solver solver, int num_sweeps, int k)

*(Optional) Sets the number of sweeps at a specified cycle.*

6.13.26

**HYPRE_ParCSRHybridSetRelaxType** (HYPRE_Solver solver, int relax_type)

*(Optional) Defines the smoother to be used.*

6.13.27

**HYPRE_ParCSRHybridSetCycleRelaxType** (HYPRE_Solver solver, int relax_type, int k)

*(Optional) Defines the smoother at a given cycle.*

6.13.28

**HYPRE_ParCSRHybridSetRelaxOrder** (HYPRE_Solver solver, int relax_order)

*(Optional) Defines in which order the points are relaxed.*

6.13.29

**HYPRE_ParCSRHybridSetRelaxWt** (HYPRE_Solver solver, double relax_wt)

*(Optional) Defines the relaxation weight for smoothed Jacobi and hybrid SOR on all levels.*

6.13.30

**HYPRE_ParCSRHybridSetLevelRelaxWt** (HYPRE_Solver solver, double relax_wt, int level)

*(Optional) Defines the relaxation weight for smoothed Jacobi and hybrid SOR on the user defined level.*

6.13.31

**HYPRE_ParCSRHybridSetOuterWt** (HYPRE_Solver solver, double outer_wt)

*(Optional) Defines the outer relaxation weight for hybrid SOR and SSOR on all levels.*

6.13.32

**HYPRE_ParCSRHybridSetLevelOuterWt** (HYPRE_Solver solver, double outer_wt, int level)

*(Optional) Defines the outer relaxation weight for hybrid SOR or SSOR on the user defined level.*

6.13.33

**HYPRE_ParCSRHybridSetMaxCoarseSize** (HYPRE_Solver solver, int max_coarse_size)

*(Optional) Defines the maximal coarse grid size.*

6.13.34

**HYPRE_ParCSRHybridSetMinCoarseSize** (HYPRE_Solver solver, int min_coarse_size)

*(Optional) Defines the minimal coarse grid size.*

6.13.35
6.13.36 int HYPRE_ParCSRHybridSetAggNumLevels (HYPRE_Solver solver, int agg_num_levels)

(Optional) Defines the number of levels of aggressive coarsening, starting with the finest level.

6.13.37 int HYPRE_ParCSRHybridSetNumPaths (HYPRE_Solver solver, int num_paths)

(Optional) Defines the degree of aggressive coarsening.

6.13.38 int HYPRE_ParCSRHybridSetNumFunctions (HYPRE_Solver solver, int num_functions)

(Optional) Sets the size of the system of PDEs, if using the systems version.

6.13.39 int HYPRE_ParCSRHybridSetDofFunc (HYPRE_Solver solver, int* dof_func)

(Optional) Sets the mapping that assigns the function to each variable, if using the systems version.

6.13.40 int HYPRE_ParCSRHybridSetNodal (HYPRE_Solver solver, int nodal)

(Optional) Sets whether to use the nodal systems version.

6.13.41 int HYPRE_ParCSRHybridGetNumIterations (HYPRE_Solver solver, int* num_its)

Retrieves the total number of iterations

6.13.42 int HYPRE_ParCSRHybridGetDSCGNumIterations (HYPRE_Solver solver, int* dscg_num_its)

Retrieves the number of iterations used by the diagonally scaled solver

6.13.43 int HYPRE_ParCSRHybridGetPCGNumIterations (HYPRE_Solver solver, int* pcg_num_its)

Retrieves the number of iterations used by the AMG preconditioned solver

6.13.44 int HYPRE_ParCSRHybridGetFinalRelativeResidualNorm (HYPRE_Solver solver, double* norm)

Retrieves the final relative residual norm
6.13.1 int HYPRE_ParCSRHybridCreate (HYPRE_Solver* solver)

Create solver object

6.13.2 int HYPRE_ParCSRHybridDestroy (HYPRE_Solver solver)

Destroy solver object

6.13.3 int HYPRE_ParCSRHybridSetup (HYPRE_Solver solver, HYPRE_ParCSRMatrix A, HYPRE_ParVector b, HYPRE_ParVector x)

Setup the hybrid solver

Parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>solver</td>
<td>[IN] object to be set up.</td>
</tr>
<tr>
<td>A</td>
<td>[IN] ParCSR matrix used to construct the solver/preconditioner.</td>
</tr>
<tr>
<td>b</td>
<td>Ignored by this function.</td>
</tr>
<tr>
<td>x</td>
<td>Ignored by this function.</td>
</tr>
</tbody>
</table>

6.13.4 int HYPRE_ParCSRHybridSolve (HYPRE_Solver solver, HYPRE_ParCSRMatrix A, HYPRE_ParVector b, HYPRE_ParVector x)

Solve linear system
Parameters:

- `solver` [IN] solver or preconditioner object to be applied.
- `A` [IN] ParCSR matrix, matrix of the linear system to be solved
- `b` [IN] right hand side of the linear system to be solved
- `x` [OUT] approximated solution of the linear system to be solved

### 6.13.5

```cpp
int HYPRE_ParCSRHybridSetTol (HYPRE_Solver solver, double tol)
```

Set the convergence tolerance for the Krylov solver. The default is 1.e-7.

### 6.13.6

```cpp
int HYPRE_ParCSRHybridSetAbsoluteTol (HYPRE_Solver solver, double tol)
```

Set the absolute convergence tolerance for the Krylov solver. The default is 0.

### 6.13.7

```cpp
int HYPRE_ParCSRHybridSetConvergenceTol (HYPRE_Solver solver, double cf_tol)
```

Set the desired convergence factor

### 6.13.8

```cpp
int HYPRE_ParCSRHybridSetDSCGMaxIter (HYPRE_Solver solver, int dscg_max_its)
```

This page has been automatically generated with DOC++

Malte Zöckler
Set the maximal number of iterations for the diagonally preconditioned solver

6.13.9

```
int HYPRE_ParCSRHybridSetPCGMaxIter (HYPRE_Solver solver, int pcg_max_its)
```

Set the maximal number of iterations for the AMG preconditioned solver

6.13.10

```
int HYPRE_ParCSRHybridSetSolverType (HYPRE_Solver solver, int solver_type)
```

Set the desired solver type. There are the following options:

1. PCG (default)
2. GMRES
3. BiCGSTAB

6.13.11

```
int HYPRE_ParCSRHybridSetKDim (HYPRE_Solver solver, int k_dim)
```

Set the Krylov dimension for restarted GMRES. The default is 5.

6.13.12

```
int HYPRE_ParCSRHybridSetTwoNorm (HYPRE_Solver solver, int two_norm)
```

Set the type of norm for PCG
Set preconditioner if wanting to use one that is not set up by the hybrid solver

Set logging parameter (default: 0, no logging)

Set print level (default: 0, no printing)

(Optional) Sets AMG strength threshold. The default is 0.25. For 2d Laplace operators, 0.25 is a good value, for 3d Laplace operators, 0.5 or 0.6 is a better value. For elasticity problems, a large strength threshold, such as 0.9, is often better.
6.13.17

```c
int HYPRE_ParCSRHybridSetMaxRowSum (HYPRE_Solver solver, double max_row_sum)
```

(Optional) Sets a parameter to modify the definition of strength for diagonal dominant portions of the matrix. The default is 0.9. If max_row_sum is 1, no checking for diagonally dominant rows is performed.

6.13.18

```c
int HYPRE_ParCSRHybridSetTruncFactor (HYPRE_Solver solver, double trunc_factor)
```

(Optional) Defines a truncation factor for the interpolation. The default is 0.

6.13.19

```c
int HYPRE_ParCSRHybridSetPMaxElmts (HYPRE_Solver solver, int P_max_elmts)
```

(Optional) Defines the maximal number of elements per row for the interpolation. The default is 0.

6.13.20

```c
int HYPRE_ParCSRHybridSetMaxLevels (HYPRE_Solver solver, int max_levels)
```

(Optional) Defines the maximal number of levels used for AMG. The default is 25.
6.13.21

```c
int HYPRE_ParCSRHybridSetMeasureType (HYPRE_Solver solver, int measure_type)
```

(Optional) Defines whether local or global measures are used

6.13.22

```c
int HYPRE_ParCSRHybridSetCoarsenType (HYPRE_Solver solver, int coarsen_type)
```

(Optional) Defines which parallel coarsening algorithm is used. There are the following options for `coarsen_type`:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>CLJP-coarsening (a parallel coarsening algorithm using independent sets).</td>
</tr>
<tr>
<td>1</td>
<td>classical Ruge-Stueben coarsening on each processor, no boundary treatment</td>
</tr>
<tr>
<td>3</td>
<td>classical Ruge-Stueben coarsening on each processor, followed by a third pass, which adds coarse points on the boundaries</td>
</tr>
<tr>
<td>6</td>
<td>Falgout coarsening (uses 1 first, followed by CLJP using the interior coarse points generated by 1 as its first independent set)</td>
</tr>
<tr>
<td>7</td>
<td>CLJP-coarsening (using a fixed random vector, for debugging purposes only)</td>
</tr>
<tr>
<td>8</td>
<td>PMIS-coarsening (a parallel coarsening algorithm using independent sets with lower complexities than CLJP, might also lead to slower convergence)</td>
</tr>
<tr>
<td>9</td>
<td>PMIS-coarsening (using a fixed random vector, for debugging purposes only)</td>
</tr>
<tr>
<td>10</td>
<td>HMIS-coarsening (uses one pass Ruge-Stueben on each processor independently, followed by PMIS using the interior C-points as its first independent set)</td>
</tr>
<tr>
<td>11</td>
<td>one-pass Ruge-Stueben coarsening on each processor, no boundary treatment</td>
</tr>
</tbody>
</table>

The default is 6.

6.13.23

```c
int HYPRE_ParCSRHybridSetCycleType (HYPRE_Solver solver, int cycle_type)
```

(Optional) Defines the type of cycle. For a V-cycle, set `cycle_type` to 1, for a W-cycle set `cycle_type` to 2. The default is 1.
6.13.24

\[ \text{int } \text{HYPRE_ParCSRHybridSetNumSweeps} \text{ (HYPRE_Solver solver, int num_sweeps)} \]

(Optional) Sets the number of sweeps. On the finest level, the up and the down cycle the number of sweeps are set to num_sweeps and on the coarsest level to 1. The default is 1.

6.13.25

\[ \text{int } \text{HYPRE_ParCSRHybridSetCycleNumSweeps} \text{ (HYPRE_Solver solver, int num_sweeps, int k)} \]

(Optional) Sets the number of sweeps at a specified cycle. There are the following options for k:

<table>
<thead>
<tr>
<th>The Cycle</th>
<th>Argument k</th>
</tr>
</thead>
<tbody>
<tr>
<td>The down cycle</td>
<td>if k=1</td>
</tr>
<tr>
<td>The up cycle</td>
<td>if k=2</td>
</tr>
<tr>
<td>The coarsest level</td>
<td>if k=3.</td>
</tr>
</tbody>
</table>

6.13.26

\[ \text{int } \text{HYPRE_ParCSRHybridSetRelaxType} \text{ (HYPRE_Solver solver, int relax_type)} \]

(Optional) Defines the smoother to be used. It uses the given smoother on the fine grid, the up and the down cycle and sets the solver on the coarsest level to Gaussian elimination (9). The default is Gauss-Seidel (3).

There are the following options for relax_type:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Jacobi</td>
</tr>
<tr>
<td>1</td>
<td>Gauss-Seidel, sequential (very slow!)</td>
</tr>
<tr>
<td>2</td>
<td>Gauss-Seidel, interior points in parallel, boundary sequential (slow!)</td>
</tr>
<tr>
<td>3</td>
<td>Hybrid Gauss-Seidel or SOR, forward solve</td>
</tr>
<tr>
<td>4</td>
<td>Hybrid Gauss-Seidel or SOR, backward solve</td>
</tr>
<tr>
<td>5</td>
<td>Hybrid chaotic Gauss-Seidel (works only with OpenMP)</td>
</tr>
<tr>
<td>6</td>
<td>Hybrid symmetric Gauss-Seidel or SSOR</td>
</tr>
<tr>
<td>9</td>
<td>Gaussian elimination (only on coarsest level)</td>
</tr>
</tbody>
</table>
6.13.27

```
int HYPRE_ParCSRHybridSetCycleRelaxType (HYPRE_Solver solver, int relax_type, int k)
```

(Optional) Defines the smoother at a given cycle. For options of relax_type see description of HYPRE_BoomerAMGSetRelaxType). Options for k are

- the down cycle if k=1
- the up cycle if k=2
- the coarsest level if k=3.

6.13.28

```
int HYPRE_ParCSRHybridSetRelaxOrder (HYPRE_Solver solver, int relax_order)
```

(Optional) Defines in which order the points are relaxed. There are the following options for relax_order:

- 0  the points are relaxed in natural or lexicographic order on each processor
- 1  CF-relaxation is used, i.e on the fine grid and the down cycle the coarse points are relaxed first, followed by the fine points; on the up cycle the F-points are relaxed first, followed by the C-points. On the coarsest level, if an iterative scheme is used, the points are relaxed in lexicographic order.

The default is 1 (CF-relaxation).

6.13.29

```
int HYPRE_ParCSRHybridSetRelaxWt (HYPRE_Solver solver, double relax_wt)
```

(Optional) Defines the relaxation weight for smoothed Jacobi and hybrid SOR on all levels.

<table>
<thead>
<tr>
<th>relax_weight</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt; 0</td>
<td>this assigns the given relaxation weight on all levels</td>
</tr>
<tr>
<td>= 0</td>
<td>the weight is determined on each level with the estimate ( \frac{3}{4|D^{-1/2}AD^{-1/2}|} ), where ( D ) is the diagonal matrix of ( A ) (this should only be used with Jacobi)</td>
</tr>
<tr>
<td>= -k</td>
<td>the relaxation weight is determined with at most k CG steps on each level this should only be used for symmetric positive definite problems</td>
</tr>
</tbody>
</table>
The default is 1.

### 6.13.30

```c
int HYPRE_ParCSRHybridSetLevelRelaxWt (HYPRE_Solver solver, double relax_wt, int level)
```

(Optional) Defines the relaxation weight for smoothed Jacobi and hybrid SOR on the user defined level. Note that the finest level is denoted 0, the next coarser level 1, etc. For nonpositive relax_weight, the parameter is determined on the given level as described for HYPRE_BoomerAMGSetRelaxWt. The default is 1.

### 6.13.31

```c
int HYPRE_ParCSRHybridSetOuterWt (HYPRE_Solver solver, double outer_wt)
```

(Optional) Defines the outer relaxation weight for hybrid SOR and SSOR on all levels.

- \( \omega > 0 \): this assigns the same outer relaxation weight to each level
- \( \omega = -k \): an outer relaxation weight is determined with at most \( k \) CG steps on each level

(this only makes sense for symmetric positive definite problems and smoothers, e.g. SSOR)

The default is 1.

### 6.13.32

```c
int HYPRE_ParCSRHybridSetLevelOuterWt (HYPRE_Solver solver, double outer_wt, int level)
```

(Optional) Defines the outer relaxation weight for hybrid SOR or SSOR on the user defined level. Note that the finest level is denoted 0, the next coarser level 1, etc. For nonpositive omega, the parameter is determined on the given level as described for HYPRE_BoomerAMGSetOuterWt. The default is 1.
6.13.33

```c
int HYPRE_ParCSRHybridSetMaxCoarseSize(HYPRE_Solver solver, int max_coarse_size)
```

(Optional) Defines the maximal coarse grid size. The default is 9.

6.13.34

```c
int HYPRE_ParCSRHybridSetMinCoarseSize(HYPRE_Solver solver, int min_coarse_size)
```

(Optional) Defines the minimal coarse grid size. The default is 0.

6.13.35

```c
int HYPRE_ParCSRHybridSetSeqThreshold(HYPRE_Solver solver, int seq_threshold)
```

(Optional) enables redundant coarse grid size. If the system size becomes smaller than seq_threshold, sequential AMG is used on all remaining processors. The default is 0.

6.13.36

```c
int HYPRE_ParCSRHybridSetAggNumLevels(HYPRE_Solver solver, int agg_num_levels)
```

(Optional) Defines the number of levels of aggressive coarsening, starting with the finest level. The default is 0, i.e. no aggressive coarsening.
6.13.37

```c
int HYPRE_ParCSRHybridSetNumPaths (HYPRE_Solver solver, int num_paths)
```

(Optional) Defines the degree of aggressive coarsening. The default is 1, which leads to the most aggressive coarsening. Setting `num_paths` to 2 will increase complexity somewhat, but can lead to better convergence.*

6.13.38

```c
int HYPRE_ParCSRHybridSetNumFunctions (HYPRE_Solver solver, int num_functions)
```

(Optional) Sets the size of the system of PDEs, if using the systems version. The default is 1.

6.13.39

```c
int HYPRE_ParCSRHybridSetDofFunc (HYPRE_Solver solver, int* dof_func)
```

(Optional) Sets the mapping that assigns the function to each variable, if using the systems version. If no assignment is made and the number of functions is \( k > 1 \), the mapping generated is \((0,1,...,k-1,0,1,...,k-1,...)\).

6.13.40

```c
int HYPRE_ParCSRHybridSetNodal (HYPRE_Solver solver, int nodal)
```

(Optional) Sets whether to use the nodal systems version. The default is 0 (the unknown based approach).
6.13.41

```c
int HYPRE_ParCSRHybridGetNumIterations (HYPRE_Solver solver, int* num its)
```

Retrieves the total number of iterations

6.13.42

```c
int HYPRE_ParCSRHybridGetDSCGNumIterations (HYPRE_Solver solver, int* dscg_num its)
```

Retrieves the number of iterations used by the diagonally scaled solver

6.13.43

```c
int HYPRE_ParCSRHybridGetPCGNumIterations (HYPRE_Solver solver, int* pcg_num its)
```

Retrieves the number of iterations used by the AMG preconditioned solver

6.13.44

```c
int HYPRE_ParCSRHybridGetFinalRelativeResidualNorm (HYPRE_Solver solver, double* norm)
```

Retrieves the final relative residual norm
6.14 ParCSR LOBPCG Eigensolver

Names

6.14.1 int \texttt{HYPRE\_ParCSRSetupInterpreter} (mv\_InterfaceInterpreter* i)
\textit{Load interface interpreter.} ........................................... 207

6.14.2 int \texttt{HYPRE\_ParCSRSetupMatvec} (HYPRE\_MatvecFunctions* mv)
\textit{Load Matvec interpreter with hypre\_ParKrylov functions} .............. 207

These routines should be used in conjunction with the generic interface in LOBPCG Eigensolver.

6.14.1

int \texttt{HYPRE\_ParCSRSetupInterpreter} (mv\_InterfaceInterpreter* i)

Load interface interpreter. Vector part loaded with hypre\_ParKrylov functions and multivector part loaded with mv\_TempMultiVector functions.

6.14.2

int \texttt{HYPRE\_ParCSRSetupMatvec} (HYPRE\_MatvecFunctions* mv)

Load Matvec interpreter with hypre\_ParKrylov functions
Krylov Solvers

Names

7.1 Krylov Solvers ................................................................. 208
7.2 PCG Solver ................................................................. 209
7.3 GMRES Solver .............................................................. 217
7.4 FlexGMRES Solver .......................................................... 224
7.5 LGMRES Solver ............................................................. 230
7.6 BiCGSTAB Solver ........................................................... 236
7.7 CGNR Solver ................................................................. 240

These solvers support many of the matrix/vector storage schemes in hypre. They should be used in conjunction with the storage-specific interfaces, particularly the specific Create() and Destroy() functions.
7.1.1
typedef struct hypre_Solver_struct *HYPRE_Solver

The solver object

7.1.2
typedef struct hypre_Matrix_struct *HYPRE_Matrix

The matrix object

7.1.3
typedef struct hypre_Vector_struct *HYPRE_Vector

The vector object

7.2
PCG Solver

Names
7.2.1 int 
HYPRE_PCGSetup (HYPRE_Solver solver, HYPRE_Matrix A,  
HYPRE_Vector b, HYPRE_Vector x)

Prepare to solve the system. ........................................... 211

209
7 Krylov Solvers

HYPRE_PCGetAbsoluteTol (HYPRE_Solver solver, double a_tol)
(Optional) Set the absolute convergence tolerance (default is 0).

7.2.5 int

HYPRE_PCGetResidualTol (HYPRE_Solver solver, double rtol)
(Optional) Set a residual-based convergence tolerance which checks if \( \|r_{old} - r_{new}\| < rtol \|b\| \).

7.2.6 int

HYPRE_PCGetMaxIter (HYPRE_Solver solver, int max_iter)
(Optional) Set maximum number of iterations

7.2.7 int

HYPRE_PCGetTwoNorm (HYPRE_Solver solver, int two_norm)
(Optional) Use the two-norm in stopping criteria

7.2.8 int

HYPRE_PCGetRelChange (HYPRE_Solver solver, int rel_change)
(Optional) Additionally require that the relative difference in successive iterates be small

7.2.9 int

HYPRE_PCGetRecomputeResidual (HYPRE_Solver solver, int recompute_residual)
(Optional) Recompute the residual at the end to double-check convergence

7.2.10 int

HYPRE_PCGetRecomputeResidualP (HYPRE_Solver solver, int recompute_residual_p)
(Optional) Periodically recompute the residual while iterating

7.2.11 int

HYPRE_PCGetPrecond (HYPRE_Solver solver, HYPRE_PtrToSolverFcn precond,
HYPRE_PtrToSolverFcn precond_setup,
HYPRE_Solver precond_solver)
(Optional) Set the preconditioner to use

7.2.12 int

HYPRE_PCGetLogging (HYPRE_Solver solver, int logging)
(Optional) Set the amount of logging to do

7.2.13 int

HYPRE_PCGetPrintLevel (HYPRE_Solver solver, int level)
(Optional) Set the amount of printing to do to the screen

7.2.14 int

HYPRE_PCGetNumIterations (HYPRE_Solver solver, int* num_iterations)
Return the number of iterations taken

7.2.15 int

HYPRE_PCGetFinalRelativeResidualNorm (HYPRE_Solver solver, double* norm)
Return the norm of the final relative residual

7.2.16 int

HYPRE_PCGetResidual (HYPRE_Solver solver, void** residual)
Return the residual
Prepare to solve the system. The coefficient data in \( \mathbf{b} \) and \( \mathbf{x} \) is ignored here, but information about the layout of the data may be used.

```cpp
int HYPRE_PCGSetup (HYPRE_Solver solver, HYPRE_Matrix A, HYPRE_Vector b, HYPRE_Vector x)
```

```cpp
int HYPRE_PCGSolve (HYPRE_Solver solver, HYPRE_Matrix A, HYPRE_Vector b, HYPRE_Vector x)
```
Solve the system

7.2.3

| int HYPRE_PCGSetTol (HYPRE_Solver solver, double tol) |

(Optional) Set the relative convergence tolerance

7.2.4

| int HYPRE_PCGSetAbsoluteTol (HYPRE_Solver solver, double a_tol) |

(Optional) Set the absolute convergence tolerance (default is 0). If one desires the convergence test to check the absolute convergence tolerance only, then set the relative convergence tolerance to 0.0. (The default convergence test is $\langle C \cdot r, r \rangle \leq \max(\text{relative tolerance}^2 \cdot \langle C \cdot b, b \rangle, \text{absolute tolerance}^2)$.)

7.2.5

| int HYPRE_PCGSetResidualTol (HYPRE_Solver solver, double rtol) |

(Optional) Set a residual-based convergence tolerance which checks if $\| r_{\text{old}} - r_{\text{new}}\| < rtol \| b \|$. This is useful when trying to converge to very low relative and/or absolute tolerances, in order to bail-out before roundoff errors affect the approximation.

7.2.6

| int HYPRE_PCGSetMaxIter (HYPRE_Solver solver, int max_iter) |

(Optional) Set maximum number of iterations
7.2.7

int HYPRE_PCGSetTwoNorm (HYPRE_Solver solver, int two_norm)

(Optional) Use the two-norm in stopping criteria

7.2.8

int HYPRE_PCGSetRelChange (HYPRE_Solver solver, int rel_change)

(Optional) Additionally require that the relative difference in successive iterates be small

7.2.9

int HYPRE_PCGSetRecomputeResidual (HYPRE_Solver solver, int recompute_residual)

(Optional) Recompute the residual at the end to double-check convergence

7.2.10

int HYPRE_PCGSetRecomputeResidualP (HYPRE_Solver solver, int recompute_residual_p)

(Optional) Periodically recompute the residual while iterating
7.2.11

```c
int HYPRE_PCGSetPrecond (HYPRE_Solver solver, HYPRE_PtrToSolverFcn precond, HYPRE_PtrToSolverFcn precond_setup, HYPRE_Solver precond_solver)
```

(Optional) Set the preconditioner to use

7.2.12

```c
int HYPRE_PCGSetLogging (HYPRE_Solver solver, int logging)
```

(Optional) Set the amount of logging to do

7.2.13

```c
int HYPRE_PCGSetPrintLevel (HYPRE_Solver solver, int level)
```

(Optional) Set the amount of printing to do to the screen

7.2.14

```c
int HYPRE_PCGGetNumIterations (HYPRE_Solver solver, int* num_iterations)
```

Return the number of iterations taken
7.2.15

int HYPRE_PCGGetFinalRelativeResidualNorm (HYPRE_Solver solver, double* norm)

Return the norm of the final relative residual

7.2.16

int HYPRE_PCGGetResidual (HYPRE_Solver solver, void** residual)

Return the residual

7.2.17

int HYPRE_PCGGetTol (HYPRE_Solver solver, double* tol)

7.2.18

int HYPRE_PCGGetResidualTol (HYPRE_Solver solver, double* rtol)

7.2.19

int HYPRE_PCGGetMaxIter (HYPRE_Solver solver, int* max_iter)
7.2.20

int HYPRE_PCGGetTwoNorm (HYPRE_Solver solver, int* two_norm)

7.2.21

int HYPRE_PCGGetRelChange (HYPRE_Solver solver, int* rel_change)

7.2.22

int HYPRE_GMRESGetSkipRealResidualCheck (HYPRE_Solver solver, int* skip_real_r_check)

7.2.23

int HYPRE_PCGGetPrecond (HYPRE_Solver solver, HYPRE_Solver* precond_data_ptr)

7.2.24

int HYPRE_PCGGetLogging (HYPRE_Solver solver, int* level)

HYPRE_GMRESGetPrintLevel (HYPRE_Solver solver, int* level)

7.3.23 int
### 7.3.1

```c
int HYPRE_GMRESSetup (HYPRE_Solver solver, HYPRE_Matrix A, HYPRE_Vector b, HYPRE_Vector x)
```

Prepare to solve the system. The coefficient data in `b` and `x` is ignored here, but information about the layout of the data may be used.

### 7.3.2

```c
int HYPRE_GMRESSolve (HYPRE_Solver solver, HYPRE_Matrix A, HYPRE_Vector b, HYPRE_Vector x)
```

Solve the system

### 7.3.3

```c
int HYPRE_GMRESSetTol (HYPRE_Solver solver, double tol)
```

(Optional) Set the relative convergence tolerance

### 7.3.4

```c
int HYPRE_GMRESSetAbsoluteTol (HYPRE_Solver solver, double a_tol)
```

(Optional) Set the absolute convergence tolerance (default is 0). If one desires the convergence test to check the absolute convergence tolerance *only*, then set the relative convergence tolerance to 0.0. (The convergence test is \( \|r\| \leq \max(\text{relative
tolerance} \cdot \|b\|, \text{absolute
tolerance}) \).)
7.3.5

int HYPRE_GMRESSetMaxIter (HYPRE_Solver solver, int max_iter)

(Optional) Set maximum number of iterations

7.3.6

int HYPRE_GMRESSetKDim (HYPRE_Solver solver, int k_dim)

(Optional) Set the maximum size of the Krylov space

7.3.7

int HYPRE_GMRESSetRelChange (HYPRE_Solver solver, int rel_change)

(Optional) Additionally require that the relative difference in successive iterates be small

7.3.8

int HYPRE_GMRESSetSkipRealResidualCheck (HYPRE_Solver solver, int skip_real_r_check)

(Optional) By default, hypre checks for convergence by evaluating the actual residual before returning from GMRES (with restart if the true residual does not indicate convergence). This option allows users to skip the evaluation and the check of the actual residual for badly conditioned problems where restart is not expected to be beneficial.
7.3.9

```c
int HYPRE_GMRESSetPrecond (HYPRE_Solver solver, HYPRE_PtrToSolverFcn precond, HYPRE_PtrToSolverFcn precond_setup, HYPRE_Solver precond_solver)
```

(Optional) Set the preconditioner to use

7.3.10

```c
int HYPRE_GMRESSetLogging (HYPRE_Solver solver, int logging)
```

(Optional) Set the amount of logging to do

7.3.11

```c
int HYPRE_GMRESSetPrintLevel (HYPRE_Solver solver, int level)
```

(Optional) Set the amount of printing to do to the screen

7.3.12

```c
int HYPRE_GMRESGetNumIterations (HYPRE_Solver solver, int* num_iterations)
```

Return the number of iterations taken
7.3.13

```
int HYPRE_GMRESGetFinalRelativeResidualNorm (HYPRE_Solver solver, double* norm)
```

Return the norm of the final relative residual

7.3.14

```
int HYPRE_GMRESGetResidual (HYPRE_Solver solver, void** residual)
```

Return the residual

7.3.15

```
int HYPRE_GMRESGetTol (HYPRE_Solver solver, double* tol)
```

7.3.16

```
int HYPRE_GMRESGetAbsoluteTol (HYPRE_Solver solver, double* tol)
```

7.3.17

```
int HYPRE_GMRESGetMaxIter (HYPRE_Solver solver, int* max_iter)
```
7.3.18

int HYPRE_GMRESGetKDim (HYPRE_Solver solver, int* k_dim)

7.3.19

int HYPRE_GMRESGetRelChange (HYPRE_Solver solver, int* rel_change)

7.3.20

7.4.1

```c
int
HYPRE_FlexGMRESSetup (HYPRE_Solver solver, HYPRE_Matrix A, HYPRE_Vector b, HYPRE_Vector x)
```

Prepare to solve the system. The coefficient data in b and x is ignored here, but information about the layout of the data may be used.

7.4.2

```c
int
HYPRE_FlexGMRESSolve (HYPRE_Solver solver, HYPRE_Matrix A, HYPRE_Vector b, HYPRE_Vector x)
```
Solve the system

7.4.3

```
int HYPRE_FlexGMRESSetTol (HYPRE_Solver solver, double tol)
```

(Optional) Set the convergence tolerance

7.4.4

```
int HYPRE_FlexGMRESSetAbsoluteTol (HYPRE_Solver solver, double a_tol)
```

(Optional) Set the absolute convergence tolerance (default is 0). If one desires the convergence test to check the absolute convergence tolerance only, then set the relative convergence tolerance to 0.0. (The convergence test is $\|r\| \leq \text{max}(\text{relative\_tolerance}$*$\|b\|$, absolute\_tolerance$).$)

7.4.5

```
int HYPRE_FlexGMRESSetMaxIter (HYPRE_Solver solver, int max_iter)
```

(Optional) Set maximum number of iterations

7.4.6

```
int HYPRE_FlexGMRESSetKDim (HYPRE_Solver solver, int k_dim)
```

(Optional) Set the maximum size of the Krylov space
### 7.4.7

```c
int HYPRE_FlexGMRESSetPrecond (HYPRE_Solver solver,
HYPRE_PtrToSolverFcn precond, HYPRE_PtrToSolverFcn precond_setup,
HYPRE_Solver precond_solver)
```

(Optional) Set the preconditioner to use

### 7.4.8

```c
int HYPRE_FlexGMRESSetLogging (HYPRE_Solver solver, int logging)
```

(Optional) Set the amount of logging to do

### 7.4.9

```c
int HYPRE_FlexGMRESSetPrintLevel (HYPRE_Solver solver, int level)
```

(Optional) Set the amount of printing to do to the screen

### 7.4.10

```c
int HYPRE_FlexGMRESGetNumIterations (HYPRE_Solver solver, int*
num_iterations)
```

Return the number of iterations taken
7.4.11

```c
int HYPRE_FlexGMRESGetFinalRelativeResidualNorm (HYPRE_Solver solver, double* norm)
```

Return the norm of the final relative residual

7.4.12

```c
int HYPRE_FlexGMRESGetResidual (HYPRE_Solver solver, void** residual)
```

Return the residual

7.4.13

```c
int HYPRE_FlexGMRESGetTol (HYPRE_Solver solver, double* tol)
```

7.4.14

```c
int HYPRE_FlexGMRESGetMaxIter (HYPRE_Solver solver, int* max_iter)
```

7.4.15

```c
int HYPRE_FlexGMRESGetKDim (HYPRE_Solver solver, int* k_dim)
```
7.4.16

```c
int HYPRE_FlexGMRESPrecond (HYPRE_Solver solver, HYPRE_Solver* precond_data_ptr)
```

7.4.17

```c
int HYPRE_FlexGMRESPrintLevel (HYPRE_Solver solver, int* level)
```

7.4.18

```c
int HYPRE_FlexGMRESPrintLevel (HYPRE_Solver solver, int* level)
```

7.4.19

```c
int HYPRE_FlexGMRESPrintConverged (HYPRE_Solver solver, int* converged)
```

7.4.20

```c
int HYPRE_FlexGMRESSetModifyPC (HYPRE_Solver solver, 
                                 HYPRE_PtrToModifyPCFcn modify_pc)
```

(Optional) Set a user-defined function to modify solve-time preconditioner attributes
7.5 LGMRES Solver

Names

7.5.1 int HYPRE_LGMRESSetup (HYPRE_Solver solver, HYPRE_Matrix A, HYPRE_Vector b, HYPRE_Vector x)
   Prepare to solve the system. .................................................. 231

7.5.2 int HYPRE_LGMRESSolve (HYPRE_Solver solver, HYPRE_Matrix A, HYPRE_Vector b, HYPRE_Vector x)
   Solve the system. ................................................................. 231

7.5.3 int HYPRE_LGMRESSetTol (HYPRE_Solver solver, double tol)
   (Optional) Set the convergence tolerance ................................. 232

7.5.4 int HYPRE_LGMRESSetAbsoluteTol (HYPRE_Solver solver, double a_tol)
   (Optional) Set the absolute convergence tolerance (default is 0). .... 232

7.5.5 int HYPRE_LGMRESSetMaxIter (HYPRE_Solver solver, int max_iter)
   (Optional) Set maximum number of iterations ............................. 232

7.5.6 int HYPRE_LGMRESSetKDim (HYPRE_Solver solver, int k_dim)
   (Optional) Set the maximum size of the approximation space (includes the augmentation vectors) ............................................. 232

7.5.7 int HYPRE_LGMRESSetAugDim (HYPRE_Solver solver, int aug_dim)
   (Optional) Set the number of augmentation vectors (default: 2) ........ 233

7.5.8 int HYPRE_LGMRESSetPrecond (HYPRE_Solver solver, HYPRE_PtrToSolverFcn precond, HYPRE_PtrToSolverFcn precond_setup, HYPRE_Solver precond_solver)
   (Optional) Set the preconditioner to use ................................. 233

7.5.9 int HYPRE_LGMRESSetLogging (HYPRE_Solver solver, int logging)
   (Optional) Set the amount of logging to do ............................... 233

7.5.10 int HYPRE_LGMRESSetPrintLevel (HYPRE_Solver solver, int level)
    (Optional) Set the amount of printing to do to the screen .......... 233

7.5.11 int HYPRE_LGMRESGetNumIterations (HYPRE_Solver solver, int* num_iterations)
    Return the number of iterations taken .................................. 233

7.5.12 int
7.5.13 int HYPRE_LGMRESGetFinalRelativeResidualNorm (HYPRE_Solver solver, double* norm)

    Return the norm of the final relative residual ................................. 234

7.5.14 int HYPRE_LGMRESGetResidual (HYPRE_Solver solver, void** residual)

    Return the residual ............................................................. 234

7.5.15 int HYPRE_LGMRESGetTol (HYPRE_Solver solver, double* tol) ............ 234

7.5.16 int HYPRE_LGMRESGetMaxIter (HYPRE_Solver solver, int* max_iter) .... 234

7.5.17 int HYPRE_LGMRESGetKDim (HYPRE_Solver solver, int* k_dim) ......... 234

7.5.18 int HYPRE_LGMRESGetAugDim (HYPRE_Solver solver, int* k_dim) ....... 234

7.5.19 int HYPRE_LGMRESGetLogging (HYPRE_Solver solver, int* level) ...... 234

7.5.20 int HYPRE_LGMRESGetPrintLevel (HYPRE_Solver solver, int* level) .... 234

7.5.21 int HYPRE_LGMRESGetConverged (HYPRE_Solver solver, int* converged) ... 234

7.5.1

    int HYPRE_LGMRESSetup (HYPRE_Solver solver, HYPRE_Matrix A, HYPRE_Vector b, HYPRE_Vector x)

Prepare to solve the system. The coefficient data in b and x is ignored here, but information about the layout of the data may be used.

7.5.2

    int HYPRE_LGMRES Solve (HYPRE_Solver solver, HYPRE_Matrix A, HYPRE_Vector b, HYPRE_Vector x)
Solve the system. Details on LGMRES may be found in A. H. Baker, E.R. Jessup, and T.A. Manteuffel, "A technique for accelerating the convergence of restarted GMRES." SIAM Journal on Matrix Analysis and Applications, 26 (2005), pp. 962-984. LGMRES(m,k) in the paper corresponds to LGMRES(Kdim+AugDim, AugDim).

### 7.5.3

```c
int HYPRE_LGMRESSetTol (HYPRE_Solver solver, double tol)
```

(Optional) Set the convergence tolerance

### 7.5.4

```c
int HYPRE_LGMRESSetAbsoluteTol (HYPRE_Solver solver, double a_tol)
```

(Optional) Set the absolute convergence tolerance (default is 0). If one desires the convergence test to check the absolute convergence tolerance only, then set the relative convergence tolerance to 0.0. (The convergence test is $\|r\| \leq \max(\text{relative\_tolerance}\times\|b\|, \text{absolute\_tolerance})$.)

### 7.5.5

```c
int HYPRE_LGMRESSetMaxIter (HYPRE_Solver solver, int max_iter)
```

(Optional) Set maximum number of iterations

### 7.5.6

```c
int HYPRE_LGMRESSetKDim (HYPRE_Solver solver, int k_dim)
```

(Optional) Set the maximum size of the approximation space (includes the augmentation vectors)
7.5.7

int `HYPRE_LGMRESSetAugDim` (HYPRE_Solver solver, int aug_dim)

(Optional) Set the number of augmentation vectors (default: 2)

7.5.8

int `HYPRE_LGMRESSetPrecond` (HYPRE_Solver solver, HYPRE_PtrToSolverFcn precond, HYPRE_PtrToSolverFcn precond_setup, HYPRE_Solver precond_solver)

(Optional) Set the preconditioner to use

7.5.9

int `HYPRE_LGMRESSetLogging` (HYPRE_Solver solver, int logging)

(Optional) Set the amount of logging to do

7.5.10

int `HYPRE_LGMRESSetPrintLevel` (HYPRE_Solver solver, int level)

(Optional) Set the amount of printing to do to the screen

7.5.11

int `HYPRE_LGMRESGetNumIterations` (HYPRE_Solver solver, int* num_iterations)
Return the number of iterations taken

#### 7.5.12

```c
int HYPRE_LGMRESGetFinalRelativeResidualNorm (HYPRE_Solver solver,
                                               double* norm)
```

Return the norm of the final relative residual

#### 7.5.13

```c
int HYPRE_LGMRESGetResidual (HYPRE_Solver solver, void** residual)
```

Return the residual

#### 7.5.14

```c
int HYPRE_LGMRESGetTol (HYPRE_Solver solver, double* tol)
```

#### 7.5.15

```c
int HYPRE_LGMRESGetMaxIter (HYPRE_Solver solver, int* max_iter)
```

#### 7.5.16

```c
int HYPRE_LGMRESGetKDim (HYPRE_Solver solver, int* k_dim)
```
7.5.17

```c
int HYPRE_LGMRESGetAugDim (HYPRE_Solver solver, int* k_dim)
```

7.5.18

```c
int HYPRE_LGMRESGetPrecond (HYPRE_Solver solver, HYPRE_Solver* precond_data_ptr)
```

7.5.19

```c
int HYPRE_LGMRESGetLogging (HYPRE_Solver solver, int* level)
```

7.5.20

```c
int HYPRE_LGMRESGetPrintLevel (HYPRE_Solver solver, int* level)
```

7.5.21

```c
int HYPRE_LGMRESGetConverged (HYPRE_Solver solver, int* converged)
```
7.6 BiCGSTAB Solver

Names

7.6.1 int HYPRE_BiCGSTABSetup (HYPRE_Solver solver, HYPRE_Matrix A, HYPRE_Vector b, HYPRE_Vector x)

*Prepare to solve the system.* 237

7.6.2 int HYPRE_BiCGSTABSolve (HYPRE_Solver solver, HYPRE_Matrix A, HYPRE_Vector b, HYPRE_Vector x)

*Solve the system.* 237

7.6.3 int HYPRE_BiCGSTABSetTol (HYPRE_Solver solver, double tol)

*(Optional) Set the convergence tolerance.* 237

7.6.4 int HYPRE_BiCGSTABSetAbsoluteTol (HYPRE_Solver solver, double a_tol)

*(Optional) Set the absolute convergence tolerance (default is 0).* 237

7.6.5 int HYPRE_BiCGSTABSetMaxIter (HYPRE_Solver solver, int max_iter)

*(Optional) Set maximum number of iterations.* 238

7.6.6 int HYPRE_BiCGSTABSetPrecond (HYPRE_Solver solver, HYPRE_PtrToSolverFcn precond, HYPRE_PtrToSolverFcn precond_setup, HYPRE_Solver precond_solver)

*Return the number of iterations taken.* 239

7.6.10 int HYPRE_BiCGSTABGetFinalRelativeResidualNorm (HYPRE_Solver solver, double* norm)

*Return the norm of the final relative residual.* 239

7.6.11 int HYPRE_BiCGSTABGetResidual (HYPRE_Solver solver, void** residual)

*Return the residual.* 239

7.6.12 int
**HYPRE_BiCGSTABGetPrecond** (HYPRE_Solver solver, HYPRE_Solver* precond_data_ptr)

7.6.1

```c
int HYPRE_BiCGSTABSetup (HYPRE_Solver solver, HYPRE_Matrix A, HYPRE_Vector b, HYPRE_Vector x)
```

Prepare to solve the system. The coefficient data in b and x is ignored here, but information about the layout of the data may be used.

7.6.2

```c
int HYPRE_BiCGSTABSolve (HYPRE_Solver solver, HYPRE_Matrix A, HYPRE_Vector b, HYPRE_Vector x)
```

Solve the system

7.6.3

```c
int HYPRE_BiCGSTABSetTol (HYPRE_Solver solver, double tol)
```

(Optional) Set the convergence tolerance

7.6.4

```c
int HYPRE_BiCGSTABSetAbsoluteTol (HYPRE_Solver solver, double a_tol)
```
(Optional) Set the absolute convergence tolerance (default is 0). If one desires the convergence test to check the absolute convergence tolerance only, then set the relative convergence tolerance to 0.0. (The convergence test is $\|r\| \leq \max(\text{relative}_{\text{tolerance}} \times \|b\|, \text{absolute}_{\text{tolerance}}).$)

7.6.5

```c
int HYPRE_BiCGSTABSetMaxIter (HYPRE_Solver solver, int max_iter)
```

(Optional) Set maximum number of iterations

7.6.6

```c
int HYPRE_BiCGSTABSetPrecond (HYPRE_Solver solver, 
HYPRE_PtrToSolverFcn precond, HYPRE_PtrToSolverFcn precond_setup, 
HYPRE_Solver precond_solver)
```

(Optional) Set the preconditioner to use

7.6.7

```c
int HYPRE_BiCGSTABSetLogging (HYPRE_Solver solver, int logging)
```

(Optional) Set the amount of logging to do

7.6.8

```c
int HYPRE_BiCGSTABSetPrintLevel (HYPRE_Solver solver, int level)
```

(Optional) Set the amount of printing to do to the screen
**7.6.9**

```c
int HYPRE_BiCGSTABGetNumIterations (HYPRE_Solver solver, int* num_iterations)
```

Return the number of iterations taken.

**7.6.10**

```c
int HYPRE_BiCGSTABGetFinalRelativeResidualNorm (HYPRE_Solver solver, double* norm)
```

Return the norm of the final relative residual.

**7.6.11**

```c
int HYPRE_BiCGSTABGetResidual (HYPRE_Solver solver, void** residual)
```

Return the residual.

**7.6.12**

```c
int HYPRE_BiCGSTABGetPrecond (HYPRE_Solver solver, HYPRE_Solver* precond_data_ptr)
```

</tr>
</tbody>
</table>
7.7.1

```
int HYPRE_CGNRSetup (HYPRE_Solver solver, HYPRE_Matrix A, 
HYPRE_Vector b, HYPRE_Vector x)
```

Prepare to solve the system. The coefficient data in \( b \) and \( x \) is ignored here, but information about the layout of the data may be used.

7.7.2

```
int HYPRE_CGNRSolve (HYPRE_Solver solver, HYPRE_Matrix A, HYPRE_Vector 
b, HYPRE_Vector x)
```

Solve the system

7.7.3

```
int HYPRE_CGNRSetTol (HYPRE_Solver solver, double tol)
```

(Optional) Set the convergence tolerance

7.7.4

```
int HYPRE_CGNRSetMaxIter (HYPRE_Solver solver, int max_iter)
```

(Optional) Set maximum number of iterations
## 7.7.5

```c
int HYPRE_CGNRSetPrecond (HYPRE_Solver solver, HYPRE_PtrToSolverFcn precond, HYPRE_PtrToSolverFcn precondT, HYPRE_PtrToSolverFcn precond_setup, HYPRE_Solver precond_solver)
```

(Optional) Set the preconditioner to use. Note that the only preconditioner available in hypre for use with CGNR is currently BoomerAMG. It requires to use Jacobi as a smoother without CF smoothing, i.e. relax_type needs to be set to 0 or 7 and relax_order needs to be set to 0 by the user, since these are not default values. It can be used with a relaxation weight for Jacobi, which can significantly improve convergence.

## 7.7.6

```c
int HYPRE_CGNRSetLogging (HYPRE_Solver solver, int logging)
```

(Optional) Set the amount of logging to do

## 7.7.7

```c
int HYPRE_CGNRGetNumIterations (HYPRE_Solver solver, int* num_iterations)
```

Return the number of iterations taken

## 7.7.8

```c
int HYPRE_CGNRGetFinalRelativeResidualNorm (HYPRE_Solver solver, double* norm)
```

Return the norm of the final relative residual
<table>
<thead>
<tr>
<th>7.7.9</th>
</tr>
</thead>
</table>

```c
int HYPRE_CGNRGetPrecond (HYPRE_Solver solver, HYPRE_Solver* precond_data_ptr)
```
These eigensolvers support many of the matrix/vector storage schemes in hypre. They should be used in conjunction with the storage-specific interfaces.
8.1.2
typedef struct hypre_Matrix_struct *HYPRE_Matrix

9.1 FEI Functions

9.1.1 LLNL_FEI_Impl (MPI_Comm comm)

Finite element interface constructor: this function creates an instantiation of the HYPRE fei class.

9.1.2 ~LLNL_FEI_Impl ()

Finite element interface destructor: this function destroys the object as well as its internal memory allocations.

9.1.3 int parameters (int numParams, char** paramStrings)

The parameter function is the single most important function to pass solver information (which solver, which preconditioner, tolerance, other solver parameters) to HYPRE.

9.1.4 int initFields (int numFields, int* fieldSizes, int* fieldIDs)

Each node or element variable has one or more fields.

9.1.5 int initElemBlock (int elemBlockID, int numElements, int numNodesPerElement, int* numFieldsPerNode, int** nodalFieldIDs, int numElemDOFFieldsPerElement, int* elemDOFFieldIDs, int interleaveStrategy)

The whole finite element mesh can be broken down into a number of element blocks.

9.1.6 int initElem (int elemBlockID, int elemID, int* elemConn)

This function initializes element connectivity (that is, the node identifiers associated with the current element) given an element block identifier and the element identifier with the element block.

9.1.7 int
initSharedNodes (int nShared, int* sharedIDs, int* sharedLengs, 
   int** sharedProcs)
   
   This function initializes the nodes that are shared between the current processor and its neighbors.

9.1.8 int
initCRMult (int CRLListLen, int* CRNodeList, int* CRFieldList, int* CRID)
   
   This function initializes the Lagrange multiplier constraints

9.1.9 int
initComplete ()
   
   This function signals to the FEI that the initialization step has been completed.

9.1.10 int
resetSystem (double s)
   
   This function resets the global matrix to be of the same sparsity pattern as before but with every entry set to s.

9.1.11 int
resetMatrix (double s)
   
   This function resets the global matrix to be of the same sparsity pattern as before but with every entry set to s.

9.1.12 int
resetRHSVector (double s)
   
   This function resets the right hand side vector to s.

9.1.13 int
resetInitialGuess (double s)
   
   This function resets the solution vector to s.

9.1.14 int
loadNodeBCs (int nNodes, int* nodeIDs, int fieldID, double** alpha,
   double** beta, double** gamma)
   
   This function loads the nodal boundary conditions.

9.1.15 int
sumInElem (int elemBlockID, int elemID, int* elemConn, double** elemStiff, 
   double* elemLoad, int elemFormat)
   
   This function adds the element contribution to the global stiffness matrix and also the element load to the right hand side vector

9.1.16 int
sumInElemMatrix (int elemBlock, int elemID, int* elemConn, 
   double** elemStiffness, int elemFormat)
   
   This function differs from the sumInElem function in that the right hand load vector is not passed.

9.1.17 int
sumInElemRHS (int elemBlock, int elemID, int* elemConn, 
   double* elemLoad)
   
   This function adds the element load to the right hand side vector

9.1.18 int
loadComplete ()
   
   This function signals to the FEI that the loading phase has been completed.
9 Finite Element Interface

9.1.20 int getNumBlockActNodes (int elemBlockID, int* nNodes)

This function returns the number of nodes given the element block.

9.1.21 int getNumBlockActEqns (int elemBlockID, int* nEqns)

This function returns the number of unknowns given the element block.

9.1.22 int getBlockNodeIDList (int elemBlockID, int numNodes, int* nodeIDList)

This function returns the node identifiers given the element block.

9.1.23 int getBlockNodeSolution (int elemBlockID, int numNodes, int* nodeIDList, int* solnOffsets, double* solnValues)

This function returns the nodal solutions given the element block number.

9.1.24 int loadCRMult (int CRID, int CRListLen, int* CRNodeList, int* CRFieldList, double* CRWeightList, double CRValue)

This function loads the Lagrange multiplier constraints.

9.1.1

LLNL_FEI_Impl (MPI_Comm comm)

Finite element interface constructor: this function creates an instantiation of the HYPRE fei class.

Parameters: 

comm - an MPI communicator

9.1.2

~LLNL_FEI_Impl ()

Finite element interface destructor: this function destroys the object as well as its internal memory allocations.

Parameters: 

- no parameter needed
9.1.3

```c
int parameters (int numParams, char** paramStrings)
```

The parameter function is the single most important function to pass solver information (which solver, which preconditioner, tolerance, other solver parameters) to HYPRE.

**Parameters:**
- `numParams` - number of command strings
- `paramStrings` - the command strings

9.1.4

```c
int initFields (int numFields, int* fieldSizes, int* fieldIDs)
```

Each node or element variable has one or more fields. The field information can be set up using this function.

**Parameters:**
- `numFields` - total number of fields for all variable types
- `fieldSizes` - degree of freedom for each field type
- `fieldIDs` - a list of field identifiers

9.1.5

```c
int initElemBlock (int elemBlockID, int numElements, int numNodesPerElement, int* numFieldsPerNode, int** nodalFieldIDs, int numElemDOFFieldsPerElement, int* elemDOFFieldIDs, int interleaveStrategy)
```

The whole finite element mesh can be broken down into a number of element blocks. The attributes for each element block are: an identifier, number of elements, number of nodes per elements, the number of fields in each element node, etc.

**Parameters:**
- `elemBlockID` - element block identifier
- `numElements` - number of element in this block
- `numNodesPerElement` - number of nodes per element in this block
- `numFieldsPerNode` - number of fields for each node
- `nodalFieldIDs` - field identifiers for the nodal unknowns
- `numElemDOFFieldsPerElement` - number of fields for the element
- `elemDOFFieldIDs` - field identifier for the element unknowns
- `interleaveStrategy` - indicates how unknowns are ordered
9.1.6

```c
int initElem (int elemBlockID, int elemID, int* elemConn)
```

This function initializes element connectivity (that is, the node identifiers associated with the current element) given an element block identifier and the element identifier with the element block.

**Parameters:**
- `elemBlockID` - element block identifier
- `elemID` - element identifier
- `elemConn` - a list of node identifiers for this element

9.1.7

```c
int initSharedNodes (int nShared, int* sharedIDs, int* sharedLengs, int** sharedProcs)
```

This function initializes the nodes that are shared between the current processor and its neighbors. The FEI will decide a unique processor each shared node will be assigned to.

**Parameters:**
- `nShared` - number of shared nodes
- `sharedIDs` - shared node identifiers
- `sharedLengs` - the number of processors each node shares with
- `sharedProcs` - the processor identifiers each node shares with

9.1.8

```c
int initCRMult (int CRLListLen, int* CRNodeList, int* CRFieldList, int* CRID)
```

This function initializes the Lagrange multiplier constraints.
Parameters:

- **CRListLen**: the number of constraints
- **CRNodeList**: node identifiers where constraints are applied
- **CRFieldList**: field identifiers within nodes where constraints are applied
- **CRID**: the constraint identifier

### 9.1.9

```c
int initComplete ()
```

This function signals to the FEI that the initialization step has been completed. The loading step will follow.

Parameters:

- no parameter needed

### 9.1.10

```c
int resetSystem (double s)
```

This function resets the global matrix to be of the same sparsity pattern as before but with every entry set to `s`. The right hand side is set to 0.

Parameters:

- `s`: the value each matrix entry is set to.

### 9.1.11

```c
int resetMatrix (double s)
```

This function resets the global matrix to be of the same sparsity pattern as before but with every entry set to `s`.

Parameters:

- `s`: the value each matrix entry is set to.
9.1.12

int resetRHSVector (double s)

This function resets the right hand side vector to s.

Parameters:
   s - the value each right hand side vector entry is set to.

9.1.13

int resetInitialGuess (double s)

This function resets the solution vector to s.

Parameters:
   s - the value each solution vector entry is set to.

9.1.14

int loadNodeBCs (int nNodes, int* nodeIDs, int fieldID, double** alpha, double** beta, double** gamma)

This function loads the nodal boundary conditions. The boundary conditions

Parameters:
   nNodes - number of nodes boundary conditions are imposed
   nodeIDs - nodal identifiers
   fieldID - field identifier with nodes where BC are imposed
   alpha - the multipliers for the field
   beta - the multipliers for the normal derivative of the field
   gamma - the boundary values on the right hand side of the equations
9.1.15

```c
int sumInElem (int elemBlockID, int elemID, int* elemConn, double** elemStiff,
               double* elemLoad, int elemFormat)
```

This function adds the element contribution to the global stiffness matrix and also the element load to the right hand side vector.

**Parameters:**
- `elemBlockID` - element block identifier
- `elemID` - element identifier
- `elemConn` - a list of node identifiers for this element
- `elemStiff` - element stiffness matrix
- `elemLoad` - right hand side (load) for this element
- `elemFormat` - the format the unknowns are passed in

9.1.16

```c
int sumInElemMatrix (int elemBlock, int elemID, int* elemConn, double**
                      elemStiffness, int elemFormat)
```

This function differs from the `sumInElem` function in that the right hand load vector is not passed.

**Parameters:**
- `elemBlockID` - element block identifier
- `elemID` - element identifier
- `elemConn` - a list of node identifiers for this element
- `elemStiff` - element stiffness matrix
- `elemFormat` - the format the unknowns are passed in

9.1.17

```c
int sumInElemRHS (int elemBlock, int elemID, int* elemConn, double* elemLoad)
```

This function adds the element load to the right hand side vector.
9.1.18

```c
int loadComplete ()
```

This function signals to the FEI that the loading phase has been completed.

Parameters:
- no parameter needed

9.1.19

```c
int getNumBlockActNodes (int elemBlockID, int* nNodes)
```

This function returns the number of nodes given the element block.

Parameters:
- `elemBlockID` - element block identifier
- `nNodes` - the number of nodes to be returned

9.1.20

```c
int getNumBlockActEqns (int elemBlockID, int* nEqns)
```

This function returns the number of unknowns given the element block.

Parameters:
- `elemBlockID` - element block identifier
- `nEqns` - the number of unknowns to be returned
9.1.21

```c
int getBlockNodeIDList (int elemBlockID, int numNodes, int* nodeIDList)
```

This function returns the node identifiers given the element block.

**Parameters:**
- `elemBlockID` - element block identifier
- `numNodes` - the number of nodes
- `nodeIDList` - the node identifiers

9.1.22

```c
int getBlockNodeSolution (int elemBlockID, int numNodes, int* nodeIDList, int* solnOffsets, double* solnValues)
```

This function returns the nodal solutions given the element block number.

**Parameters:**
- `elemBlockID` - element block identifier
- `numNodes` - the number of nodes
- `nodeIDList` - the node identifiers
- `solnOffsets` - the equation number for each nodal solution
- `solnValues` - the nodal solution values

9.1.23

```c
int loadCRMult (int CRID, int CRListLen, int* CRNodeList, int* CRFieldList, double* CRWeightList, double CRValue)
```

This function loads the Lagrange multiplier constraints.

**Parameters:**
- `CRID` - the constraint identifier
- `CRListLen` - the number of constraints
- `CRNodeList` - node identifiers where constraints are applied
- `CRFieldList` - field identifiers within nodes where constraints are applied
- `CRWeightList` - a list of weights applied to each specified field
- `CRValue` - the constraint value (right hand side of the constraint)
9.2

FEI Solver Parameters

Names
9.2.1 Preconditioners and Solvers
Here the various options for solvers and preconditioners are defined. ...... 260

9.2.2 BoomerAMG
Parameter options for the algebraic multigrid preconditioner BoomerAMG. ........................................................... 261

9.2.3 MLI
Parameter options for the smoothed aggregation preconditioner MLI. ...... 262

9.2.4 Various
Parameter options for ILUT, ParaSails and polynomial preconditioners are defined. ......................................................... 263

9.2.5 Matrix Reduction
Parameters which define different reduction modes. ......................... 264

9.2.6 Performance Tuning and Diagnostics
Parameters control diagnostic information, memory use, etc. .......... 264

9.2.7 Miscellaneous
Parameters that are helpful for finite element information. ............... 265

9.2.1 Preconditioners and Solvers

Here the various options for solvers and preconditioners are defined.

solver xxx where xxx specifies one of cg, gmres, fgmres, bicgs, bicgstab, tfqmr, symqmr, superlu, or superlux. The default is gmres. The solver type can be followed by override to specify its priority when multiple solvers are declared at random order.

preconditioner xxx where xxx is one of diagonal, pilut, euclid, parasails, boomeramg, poly, or mli. The default is diagonal. Another option for xxx is reuse which allows the preconditioner to be reused (this should only be set after a preconditioner has been set up already). The preconditioner type can be followed by override to specify its priority when multiple preconditioners are declared at random order.
maxIterations xxx where xxx is an integer specifying the maximum number of iterations permitted for the iterative solvers. The default value is 1000.

tolerance xxx where xxx is a floating point number specifying the termination criterion for the iterative solvers. The default value is 1.0E-6.

gmresDim xxx where xxx is an integer specifying the value of m in restarted GMRES(m). The default value is 100.

stopCrit xxx where xxx is one of absolute or relative stopping criterion.

superluOrdering xxx - where xxx specifies one of natural or mmd (minimum degree ordering). This ordering is used to minimize the number of nonzeros generated in the LU decomposition. The default is natural ordering.

superluScale xxx where xxx specifies one of y (perform row and column scalings before decomposition) or n. The default is no scaling.

9.2.2

BoomerAMG

Parameter options for the algebraic multigrid preconditioner BoomerAMG.

amgMaxLevels xxx where xxx is an integer specifying the maximum number of levels to be used for the grid hierarchy.

amgCoarsenType xxx where xxx specifies one of falgout or ruge, or default (CLJP) coarsening for BoomerAMG.

amgMeasureType xxx where xxx specifies one of local or or global. This parameter affects how coarsening is performed in parallel.

amgRelaxType xxx where xxx is one of jacobi (Damped Jacobi), gs-slow (sequential Gauss-Seidel), gs-fast (Gauss-Seidel on interior nodes), or hybrid. The default is hybrid.

amgNumSweeps xxx where xxx is an integer specifying the number of pre- and post-smoothing at each level of BoomerAMG. The default is two pre- and two post-smoothings.

amgRelaxWeight xxx where xxx is a floating point number between 0 and 1 specifying the damping factor for BoomerAMG’s damped Jacobi and GS smoothers. The default value is 1.0.

amgRelaxOmega xxx where xxx is a floating point number between 0 and 1 specifying the damping factor for BoomerAMG’s hybrid smoother for multiple processors. The default value is 1.0.

amgStrongThreshold xxx where xxx is a floating point number between 0 and 1 specifying the threshold used to determine strong coupling in BoomerAMG’s coarsening. The default value is 0.25.

amgSystemSize xxx where xxx is the degree of freedom per node.
amgMaxLevels \( xxx \) where \( xxx \) is an integer specifying the maximum number of iterations to be used during the solve phase.

amgUseGSMG - tells BoomerAMG to use a different coarsening called GSMG.

amgGSMGNumSamples where \( xxx \) is the number of samples to generate to determine how to coarsen for GSMG.

---

### 9.2.3

**MLI**

Parameter options for the smoothed aggregation preconditioner MLI.

outputLevel \( xxx \) where \( xxx \) is the output level for diagnostics.

method \( xxx \) where \( xxx \) is either AMGSA (default), AMGSAe, to indicate which MLI algorithm is to be used.

numLevels \( xxx \) where \( xxx \) is the maximum number of levels (default=30) used.

maxIterations \( xxx \) where \( xxx \) is the maximum number of iterations (default = 1 as preconditioner).

cycleType \( xxx \) where \( xxx \) is either 'V' or 'W' cycle (default = 'V').

strengthThreshold \( xxx \) strength threshold for coarsening (default = 0).

smoother \( xxx \) where \( xxx \) is either Jacobi, BJacobi, GS, SGS, HSGS (SSOR, default), BSGS, ParaSails, MLS, CGJacobi, CGBJacobi, or Chebyshev.

numSweeps \( xxx \) where \( xxx \) is the number of smoother sweeps (default = 2).

coarseSolver \( xxx \) where \( xxx \) is one of those in 'smoother' or SuperLU (default).

minCoarseSize \( xxx \) where \( xxx \) is the minimum coarse grid size to control the number of levels used (default = 3000).

Pweight \( xxx \) where \( xxx \) is the relaxation parameter for the prolongation smoother (default 0.0).

nodeDOF \( xxx \) where \( xxx \) is the degree of freedom for each node (default = 1).

nullSpaceDim \( xxx \) where \( xxx \) is the dimension of the null space for the coarse grid (default = 1).

useNodalCoord \( xxx \) where \( xxx \) is either 'on' or 'off' (default) to indicate whether the nodal coordinates are used to generate the initial null space.

saAMGCalibrationSize \( xxx \) where \( xxx \) is the additional null space vectors to be generated via calibration (default = 0).

numSmoothVecs \( xxx \) where \( xxx \) is the number of near null space vectors used to create the prolongation operator (default = 0).
smoothVecSteps xxx where xxx is the number of smoothing steps used to generate the smooth vectors (default = 0).

In addition, to use 'AMGSAe', the parameter 'haveSFEI' has to be sent into the FEI using the parameters function (this option is valid only for the Sandia FEI implementation).

### 9.2.4 Various

Parameter options for ILUT, ParaSails and polynomial preconditioners are defined.

**euclidNlevels xxx** where xxx is an non-negative integer specifying the desired sparsity of the incomplete factors. The default value is 0.

**euclidThreshold xxx** where xxx is a floating point number specifying the threshold used to sparsify the incomplete factors. The default value is 0.0.

**parasailsThreshold xxx** where xxx is a floating point number between 0 and 1 specifying the threshold used to prune small entries in setting up the sparse approximate inverse. The default value is 0.0.

**parasailsNlevels xxx** where xxx is an integer larger than 0 specifying the desired sparsity of the approximate inverse. The default value is 1.

**parasailsFilter xxx** where xxx is a floating point number between 0 and 1 specifying the threshold used to prune small entries in $A$. The default value is 0.0.

**parasailsLoadbal xxx** where xxx is a floating point number between 0 and 1 specifying how load balancing has to be done (Edmond, explain please). The default value is 0.0.

**parasailsSymmetric** sets Parasails to take $A$ as symmetric.

**parasailsUnSymmetric** sets Parasails to take $A$ as nonsymmetric (default).

**parasailsReuse** sets Parasails to reuse the sparsity pattern of $A$.

**polyorder xxx** where xxx is the order of the least-squares polynomial preconditioner.
9.2.5  

Matrix Reduction

Parameters which define different reduction modes.

- `schurReduction` turns on the Schur reduction mode.
- `slideReduction` turns on the slide reduction mode.
- `slideReduction2` turns on the slide reduction mode version 2 (see section 2).
- `slideReduction3` turns on the slide reduction mode version 3 (see section 2).

9.2.6  

Performance Tuning and Diagnostics

Parameters control diagnostic information, memory use, etc.

- `outputLevel xxx` where xxx is an integer specifying the output level. An output level of 1 prints only the solver information such as number of iterations and timings. An output level of 2 prints debug information such as the functions visited and preconditioner information. An output level of 3 or higher prints more debug information such as the matrix and right hand side loaded via the LinearSystemCore functions to the standard output.

- `setDebug xxx` where xxx is one of `slideReduction1`, `slideReduction2`, `slideReduction3` (level 1,2,3 diagnostics in the slide surface reduction code), `printMat` (print the original matrix into a file), `printReducedMat` (print the reduced matrix into a file), `printSol` (print the solution into a file), `ddilut` (output diagnostic information for DDIlut preconditioner setup), and `amgDebug` (output diagnostic information for AMG).

- `optimizeMemory` cleans up the matrix sparsity pattern after the matrix has been loaded. (It has been kept to allow matrix reuse.)

- `imposeNoBC` turns off the boundary condition to allow diagnosing the matrix (for example, checking the null space.)
9.2.7

**Miscellaneous**

Parameters that are helpful for finite element information.

- **AConjugateProjection xxx** where xxx specifies the number of previous solution vectors to keep for the A-conjugate projection. The default is 0 (the projection is off).
- **minResProjection xxx** where xxx specifies the number of previous solution vectors to keep for projection. The default is 0 (the projection is off).
- **haveFEData** indicates that additional finite element information are available to assist in building more efficient solvers.
- **haveSFEI** indicates that the simplified finite element information are available to assist in building more efficient solvers.
